

2022 WEB MAPPING CODE SPRINT SUMMARY ENGINEERING REPORT

ENGINEERING REPORT

DRAFT

Submission Date: 2018-12-20

Approval Date: 2018-07-10

Publication Date: 2028-06-12

Editor: Gobe Hobona, Joana Simoes

Notice: This document is not an OGC Standard. This document is an OGC Public Engineering Report created as a deliverable in an OGC Interoperability Initiative and is *not an official position* of the OGC membership. It is distributed for review and comment. It is subject to change without notice and may not be referred to as an OGC Standard.

Further, any OGC Engineering Report should not be referenced as required or mandatory technology in procurements. However, the discussions in this document could very well lead to the definition of an OGC Standard.

License Agreement

Permission is hereby granted by the Open Geospatial Consortium, ("Licensor"), free of charge and subject to the terms set forth below, to any person obtaining a copy of this Intellectual Property and any associated documentation, to deal in the Intellectual Property without restriction (except as set forth below), including without limitation the rights to implement, use, copy, modify, merge, publish, distribute, and/or sublicense copies of the Intellectual Property, and to permit persons to whom the Intellectual Property is furnished to do so, provided that all copyright notices on the intellectual property are retained intact and that each person to whom the Intellectual Property is furnished agrees to the terms of this Agreement.

If you modify the Intellectual Property, all copies of the modified Intellectual Property must include, in addition to the above copyright notice, a notice that the Intellectual Property includes modifications that have not been approved or adopted by LICENSOR.

THIS LICENSE IS A COPYRIGHT LICENSE ONLY, AND DOES NOT CONVEY ANY RIGHTS UNDER ANY PATENTS THAT MAY BE IN FORCE ANYWHERE IN THE WORLD. THE INTELLECTUAL PROPERTY IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NONINFRINGEMENT OF THIRD PARTY RIGHTS. THE COPYRIGHT HOLDER OR HOLDERS INCLUDED IN THIS NOTICE DO NOT WARRANT THAT THE FUNCTIONS CONTAINED IN THE INTELLECTUAL PROPERTY WILL MEET YOUR REQUIREMENTS OR THAT THE OPERATION OF THE INTELLECTUAL PROPERTY WILL BE UNINTERRUPTED OR ERROR FREE. ANY USE OF THE INTELLECTUAL PROPERTY SHALL BE MADE ENTIRELY AT THE USER'S OWN RISK. IN NO EVENT SHALL THE COPYRIGHT HOLDER OR ANY CONTRIBUTOR OF INTELLECTUAL PROPERTY RIGHTS TO THE INTELLECTUAL PROPERTY BE LIABLE FOR ANY CLAIM, OR ANY DIRECT, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, OR ANY DAMAGES WHATSOEVER RESULTING FROM ANY ALLEGED INFRINGEMENT OR ANY LOSS OF USE, DATA OR PROFITS, WHETHER IN AN ACTION OF CONTRACT, NEGLIGENCE OR UNDER ANY OTHER LEGAL THEORY, ARISING OUT OF OR IN CONNECTION WITH THE IMPLEMENTATION, USE, COMMERCIALIZATION OR PERFORMANCE OF THIS INTELLECTUAL PROPERTY.

This license is effective until terminated. You may terminate it at any time by destroying the Intellectual Property together with all copies in any form. The license will also terminate if you fail to comply with any term or condition of this Agreement. Except as provided in the following sentence, no such termination of this license shall require the termination of any third party end-user sublicense to the Intellectual Property which is in force as of the date of notice of such termination. In addition, should the Intellectual Property, or the operation of the Intellectual Property, infringe, or in LICENSOR's sole opinion be likely to infringe, any patent, copyright, trademark or other right of a third party, you agree that LICENSOR, in its sole discretion, may terminate this license without any compensation or liability to you, your licensees or any other party. You agree upon termination of any kind to destroy or cause to be destroyed the Intellectual Property together with all copies in any form, whether held by you or by any third party.

Except as contained in this notice, the name of LICENSOR or of any other holder of a copyright in all or part of the Intellectual Property shall not be used in advertising or otherwise to promote the sale, use or other dealings in this Intellectual Property without prior written authorization of LICENSOR or such copyright holder. LICENSOR is and shall at all times be the sole entity that may authorize you or any third party to use certification marks, trademarks or other special designations to indicate compliance with any LICENSOR standards or specifications. This Agreement is governed by the laws of the Commonwealth of Massachusetts. The application to this Agreement of the United Nations Convention on Contracts for the International Sale of Goods is hereby expressly excluded. In the event any provision of this Agreement shall be deemed unenforceable, void or invalid, such provision shall be modified so as to make it valid and enforceable, and as so modified the entire Agreement shall remain in full force and effect. No decision, action or inaction by LICENSOR shall be construed to be a waiver of any rights or remedies available to it.

None of the Intellectual Property or underlying information or technology may be downloaded or otherwise exported or reexported in violation of U.S. export laws and regulations. In addition, you are responsible for complying with any local laws in your jurisdiction which may impact your right to import, export or use the Intellectual Property, and you represent that you have complied with any regulations or registration procedures required by applicable law to make this license enforceable.

EXECUTIVE SUMMARY

The code sprint focused on the following group of specifications:

- [OGC API – Maps](#) candidate Standard
- [OGC API – Tiles](#) Standard
- [OGC API – Styles](#) candidate Standard
- [OGC Symbology Conceptual Model: Core Part](#)

The sprint objectives for the Standards Working Groups (SWGs) were to:

- Develop prototype implementations of OGC Standards, including implementations of draft OGC Application Programming Interface (API) Standards;
- Test the prototype implementations;
- Provide feedback to the Editor about what worked and what did not; and
- Provide feedback about the specification document.

This engineering report makes the following recommendations for future innovation work items:

- TBA
- TBA
- TBA

The engineering report also makes the following recommendations for things that the Standards Working Groups should consider:

- TBA
- TBA
- TBA

KEYWORDS

The following are keywords to be used by search engines and document catalogues.

hackathon, application-to-the-cloud, testbed, docker, web service

SECURITY CONSIDERATIONS

V

ABSTRACT

The subject of this Engineering Report (ER) is a code sprint that was held from November 29th to December 1st, 2022 to advance OGC API Standards that relate to web mapping, and others that relate to styling and symbology encoding standards. The code sprint was hosted by the Open Geospatial Consortium (OGC) and EuroGeographics. The code sprint was sponsored by Ordnance Survey (OS), and was held as a hybrid event with the face-to-face element hosted at the Mundo Madou centre in Brussels, Belgium.

1

SCOPE

SCOPE

A Code Sprint is a collaborative and inclusive event driven by innovative and rapid programming with minimal process and organization constraints to support the development of new applications and open standards. Code Sprints experiment with emerging ideas in the context of geospatial standards, help improve interoperability of existing standards by experimenting with new extensions or profiles, and are used for building proofs of concept to support standards development activities and enhancement of software products.

The code sprint described in this engineering report focused on the following specifications:

- [OGC API – Maps candidate Standard](#)
- [OGC API – Tiles Standard](#)
- [OGC API – Styles candidate Standard](#)
- [OGC Symbology Conceptual Model: Core Part](#)

The code sprint was organized to provide a collaborative environment that enables software developers, users, and architects to work together on open standards that relate to web mapping, styles, and symbology. The engineering report presents the sprint architecture, the results of the prototyping, and a discussion resulting from the prototyping.

TERMS, DEFINITIONS AND ABBREVIATED TERMS

TERMS, DEFINITIONS AND ABBREVIATED TERMS

This document uses the terms defined in [OGC Policy Directive 49](#), which is based on the ISO/IEC Directives, Part 2, Rules for the structure and drafting of International Standards. In particular, the word “shall” (not “must”) is the verb form used to indicate a requirement to be strictly followed to conform to this document and OGC documents do not use the equivalent phrases in the ISO/IEC Directives, Part 2.

This document also uses terms defined in the OGC Standard for Modular specifications ([OGC 08-131r3](#)), also known as the ‘ModSpec’. The definitions of terms such as standard, specification, requirement, and conformance test are provided in the ModSpec.

For the purposes of this document, the following additional terms and definitions apply.

3.1. API

An Application Programming Interface (API) is a standard set of documented and supported functions and procedures that expose the capabilities or data of an operating system, application, or service to other applications [adapted from ISO/IEC TR 13066-2:2016].

3.2. coordinate reference system

A coordinate system that is related to the real world by a datum term name [source: ISO 19111]

3.3. dataset

a set of data, published or curated by a single agent, and available for access or download in one or more representations (modified from DCAT: <https://www.w3.org/TR/vocab-dcat-2/#dcatscope>).

Note 1 to entry: A Web API implementing OGC API – Common often gives access to a single dataset which may be comprised of one or more *geospatial data resources*.

3.4. geospatial data resource

web accessible resource that consists of a set of geospatial data

Note 1 to entry: In Web APIs implementing OGC API – Common – Part 2: Geospatial Data, geospatial data resources are referred to as collections and are defined in the *collections* conformance class.

Note 2 to entry: *geodata* is sometimes used in this document as an abbreviation of *geospatial data*

3.5. geospatial resource aspect

web accessible resource that represents a component of geospatial information (metadata, schemas...) or geospatial data accessed using a particular mechanism and data model (e.g., feature items, tiles, maps, coverages,...) of a more generic geospatial data resource (e.g., a collection)

Note 1 to entry: Not to be confused with a web accessible resource representation. While resource representations share the same path and are selected by format negotiation, geospatial aspects use different paths. Commonly a geospatial aspect is a subpath of a geospatial data resource.

3.6. map tile

tile that contains information in a raster form where the values of cells are colors which can be readily displayed on rendering devices

Note 1 to entry: Map tiles are generated in combination with OGC API – Maps.

3.7. OpenAPI Document

A document (or set of documents) that defines or describes an API. An OpenAPI definition uses and conforms to the OpenAPI Specification (<https://www.openapis.org>)

3.8. geographic information

information concerning phenomena implicitly or explicitly associated with a location relative to the Earth (source: ISO 19101)

3.9. map

portrayal of geographic information as a digital image file suitable for display on a computer screen (source: OGC 06-042)

3.10. portrayal

presentation of information to humans (source: ISO 19117)

3.11. map tile

tile that contains information in a raster form where the values of cells are colors which can be readily displayed on rendering devices

Note 1 to entry: Map tiles are generated in combination with OGC API – Maps.

3.12. tile

geometric shape with known properties that may or may not be the result of a tiling (tessellation) process. A tile consists of a single connected “piece” without “holes” or “lines” (topological disc).

In the context of a 2D *tile matrix*, a *tile* is one of the rectangular regions of space, which can be uniquely identified by row and column integer indices, making up the tile matrix.

In the context of a geospatial data *tile set*, a *tile* contains data for such a partition of space as part of an overall set of tiles for that tiled geospatial data.

Note 1 to entry: From OGC 19-014r1: Core Tiling Conceptual and Logical Models for 2D Euclidean Space

Note 2 to entry: From OGC 17-083r4: OGC Two Dimensional Tile Matrix Set and Tile Set Metadata standard

Note 3 to entry: Tiles are useful to efficiently request, transfer, cache, display, store and process geospatial data for a specific resolution and area of interest, providing deterministic performance and scalability for arbitrarily large datasets.

Note 4 to entry: Tiles can contain a variety of data types, such as grid-based pictorial representations (map tiles), coverage subsets (coverage tiles), or feature-based representations (vector tiles).

3.13. tile matrix

tiling grid in a given 2D coordinate reference system, associated to a specific scale and partitioning space into regular conterminous *tiles*, each of which being assigned a unique identifier

Note 1 to entry: From OGC 17-083r4: OGC Two Dimensional Tile Matrix Set and Tile Set Metadata standard

Note 2 to entry: Each tile of a tile matrix is uniquely identifiable by a row and a column integer index. The number of rows is referred to as the *matrix height*, while the maximum number of columns is referred to as the *matrix width* (the number of columns can vary for different rows in *variable width tile matrices*).

3.14. tile matrix set

tiling scheme consisting of a set of *tile matrices* defined at different scales covering approximately the same area and having a common coordinate reference system.

Note 1 to entry: From OGC 17-083r4: OGC Two Dimensional Tile Matrix Set and Tile Set Metadata standard

3.15. tile set

a set of *tiles* resulting from tiling data according to a particular *tiling scheme*

Note 1 to entry: From OGC 19-014r1: Core Tiling Conceptual and Logical Models for 2D Euclidean Space, but adapted to clarify that in the context of this document, a tile set refers specifically to a set of tiles containing data and following a common tiling scheme.

3.16. Web API

API using an architectural style that is founded on the technologies of the Web [source: OGC API – Features – Part 1: Core]

3.17. Abbreviated terms

API	Application Programming Interface
CRS	Coordinate Reference System
GIS	Geographic Information System
OGC	Open Geospatial Consortium
OWS	OGC Web Services
REST	Representational State Transfer

4

HIGH-LEVEL ARCHITECTURE

HIGH-LEVEL ARCHITECTURE

As illustrated in Figure 1, the sprint architecture was designed with the view of enabling client applications to connect to different servers that implement open geospatial standards that relate to web mapping, styles and symbology. Implementations of OGC API – Maps, OGC API – Tiles, and OGC API – Styles were deployed in participants' own infrastructure in order to build a solution with the architecture shown below in Figure 1.

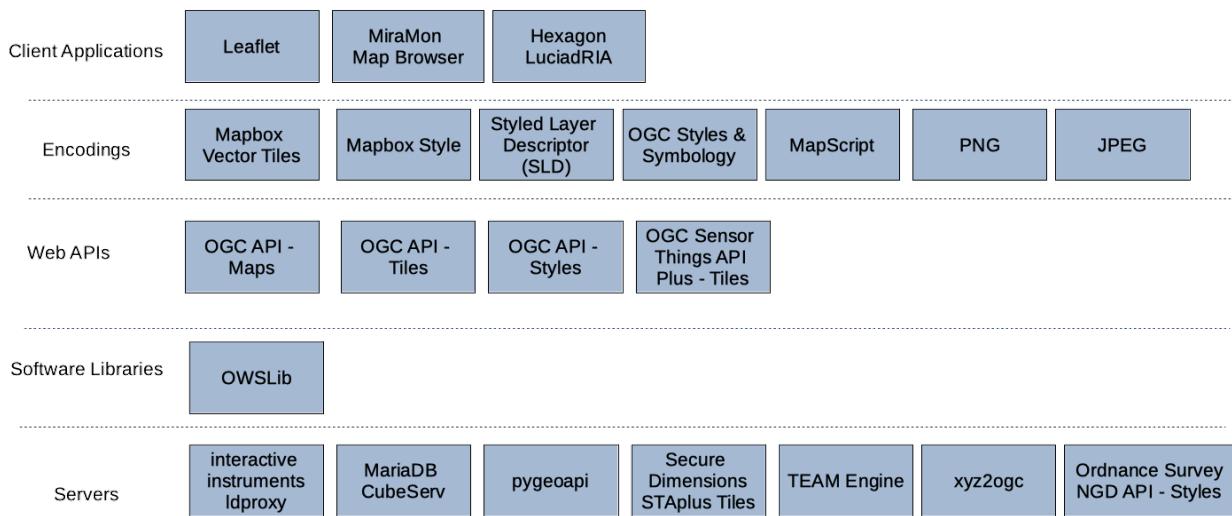

Figure 1 – High Level Overview of the Sprint Architecture

The rest of this section describes the software deployed and standards implemented during the code sprint.

4.1. Approved and Draft Standards

This section describes the approved and draft standards implemented during the code sprint.

4.1.1. OGC API – Maps

The OGC API – Maps draft specification describes an API that can serve spatially referenced and dynamically rendered electronic maps. The specification describes the discovery and query operations of an API that provides access to electronic maps in a manner independent of the underlying data store. The query operations allow dynamically rendered maps to be retrieved from the underlying data store based upon simple selection criteria, defined by the client.

4.1.2. OGC API – Styles

OGC API – Styles specifies building blocks for Web APIs that enable map servers and clients as well as visual style editors to manage and fetch styles that consist of symbolizing instructions that can be applied by a rendering engine on features and/or coverages. The API implements the conceptual model for style encodings and style metadata. The model defines three main concepts, namely the style, stylesheet, and style metadata. The concepts are explained below:

- The **style** is the main resource.
- Each style is available in one or more **stylesheets** – the representation of a style in an encoding like OGC SLD 1.0 or Mapbox Style. Clients will use the stylesheet of a style that fits best based on the capabilities of available tools and their preferences.
- For each style there is **style metadata** available, with general descriptive information about the style, structural information (e.g., layers and attributes), and so forth to allow users to discover and select existing styles for their data.

4.1.3. OGC API – Tiles

OGC API – Tiles specifies a standard for Web APIs that provide tiles of geospatial information. The standard supports different forms of geospatial information, such as tiles of vector features (“vector tiles”), coverages, maps (or imagery) and potentially eventually additional types of tiles of geospatial information.

Vector data represents geospatial objects such as points, lines, and polygons. Tiles of vector feature data (i.e. Vector Tiles) represent partitions of vector data covering a large area (e.g. lines representing rivers in a country).

In this context, a map is essentially an image representing at least one type of geospatial information. Tiles of maps (i.e. Map Tiles) represent subsets of maps covering a large area (e.g. a satellite image).

4.1.4. OGC STAplus – an extension of the OGC SensorThings API

STAplus is an extension to the OGC SensorThings data model. Inspired by Citizen Science applications, STAplus supports the ‘ownership concept’ whereby observations collected by sensors are owned by (different) users that may express the license for re-use. In addition to the ownership and license abilities, the extension specified by STAplus supports the expression of explicit relations between observations and the creation of group(s) of observations.

4.1.5. OGC Styled Layer Descriptor

The Styled Layer Descriptor (SLD) encoding standard defines an encoding that supports user-defined symbolization and coloring of geographic feature and coverage data. SLD addresses

the need for users and software to be able to control the visual portrayal of the geospatial data. The ability to define styling rules requires a styling language that the client and server can both understand. SLD is often used in combination with the OGC Symbology Encoding Standard (SE).

4.2. Open Source Software Projects

This section describes open source software products that were deployed during the code sprint.

4.2.1. Leaflet

[Leaflet](#) is a popular Javascript library for displaying maps in web pages, created in 2011 by Volodymir Agafonkin and released under a BSD-2 license. It has a minimalistic architectural design in order to provide a small code footprint. As a result, any advanced or specific functionality is implemented by plugins.

[Leaflet.ImageOverlay.OCGAPI](#) is a Leaflet plugin implementing a OGC API – Maps client, and was created during a previous codesprint.

4.2.2. Idproxy

[Idproxy](#) is an implementation of the OGC API family of specifications, inspired by the W3C/OGC Spatial Data on the Web Best Practices. Idproxy is developed by interactive instruments GmbH, written in Java (Source Code), and is typically deployed using docker (DockerHub). In addition to supporting commonly used data formats for geospatial data, an emphasis is placed on an intuitive HTML representation.

The current version supports PostgreSQL/PostGIS databases, GeoPackages and WFS 2.0 instances as backends for feature data. MBTiles is supported for tilesets.

Idproxy implements all conformance classes and recommendations of “OGC API – Features – Part 1: Core” and “OGC API – Features – Part 2: Coordinate Reference Systems By Reference” and is an OGC Reference Implementation for the two standards. Idproxy also supports the OGC API Records draft as well as the draft extensions of OGC API – Features (that is Part 3, CQL2, Part 4 and most of the current proposals discussed by the Features API working group). It supports GeoJSON, JSON-FG, HTML, FlatGeoBuf, CityJSON, glTF 2.0 and GML as feature encodings.

Idproxy also has implementations for additional resource types: Vector and Map Tiles, Styles, Routes, 3D Tilesets.

Idproxy is distributed under the Mozilla Public License 2.0.

4.2.3. OSGeo OWSLib

[OWSLib](#) is a Python client for OGC Web Services and their related content models. The project is an OSGeo Community project and is released under a BSD 3-Clause License.

OWSLib supports numerous OGC standards, including increasing support for the OGC API suite of standards. The [official documentation](#) provides an overview of all supported standards.

4.2.4. OSGeo pygeoapi

[pygeoapi](#) is a Python server implementation of the OGC API suite of standards. The project emerged as part of the next generation OGC API efforts in 2018 and provides the capability for organizations to deploy a RESTful OGC API endpoint using OpenAPI, GeoJSON, and HTML. pygeoapi is open source and released under an MIT license. pygeoapi is an official OSGeo Project as well as an OGC Reference Implementation.

pygeoapi supports numerous OGC API Standards. The [official documentation](#) provides an overview of all supported standards.

4.2.5. STAplus Viewer App by Secure Dimensions

The STAplus Viewer App is a proof of concept implementation as Web-Browser application based on JavaScript and Leaflet. The implementation further leverages JS libraries from [STAM](#) (SensorThings API Map) developed by Datacove for INSPIRE.

The STAplus Viewer App is based on the Leaflet JavaScript library. It is however possible to base the application on OpenLayers. This alternative implementation is available from the [COS4Cloud project](#). Even though it looks and feels slightly different, both implementations provide the same functionality.

4.2.6. TEAM Engine

The [Test, Evaluation, And Measurement \(TEAM\) Engine](#) is a testing facility that executes test suites developed using the TestNG framework or the OGC Compliance Test Language (CTL). It is typically used to verify specification compliance and is the official test harness of the [OGC Compliance Testing Program \(CITE\)](#).

4.2.7. xyz2ogc

The [xyz2ogc](#) program supports the generation of OGC API – Tiles metadata from existing XYZ tilesets. The program is implemented in the Go programming language.

4.3. Proprietary products

This section describes proprietary software products that were deployed during the code sprint.

4.3.1. MariaDB CubeWerx CubeServ

The CubeWerx server ("cubeserv") is implemented in C and currently implements the following OGC Standards and draft specifications.

- Multiple conformance classes and recommendations of the OGC API – Tiles – Part 1: Core Standard.
- Multiple conformance classes and recommendations of the OGC API – Maps – Part 1: Core candidate Standard.
- All conformance classes and recommendations of the OGC API – Features – Part 1: Core Standard.
- Multiple conformance classes and recommendations of the OGC API – Records – Part 1: Core candidate Standard.
- Multiple conformance classes and recommendations of the OGC API – Coverages – Part 1: Core candidate Standard.
- Multiple conformance classes and recommendations of the OGC API – Processes – Part 1: Core Standard.
- Multiple versions of the Web Map Service (WMS), Web Processing Service (WPS), Web Map Tile Service (WMTS) and Web Feature Service (WFS) Standards.
- A number of other “un-adopted” OGC Web Service draft specifications including the Testbed-12 Web Integration Service, OWS-7 Engineering Report – GeoSynchronization Service, and the Web Object Service prototype.

The cubeserv executable supports a wide variety of back ends including Oracle, MariaDB, SHAPE files, etc. It also supports a wide array of service-dependent output formats (e.g., GML, GeoJSON, Mapbox Vector Tiles, MapMP, etc.) and coordinate reference systems.

4.3.2. Ordnance Survey Implementation of OGC API – Styles

Ordnance Survey (OS) works with a wide array of customers and partners across many industries in the United Kingdom and beyond. A key part of the current OS Roadmap is the suite of products to deliver the OS National Geographic Database (OS NGD). At the end of September 2022, OS launched the OS NGD API – Features product which implements Parts 1, 2, and 3 of OGC API – Features to provide access to data along with filtering capabilities to enable customers to retrieve just the data they need. During the code sprint, developers from

OS focuses on implementation of the OGC API – Styles candidate standard. The work at the code sprint complemented other OS activities that are implementing OGC API – Tiles.

4.3.3. GNOSIS Map Server

The [GNOSIS Map Server](#) is written in the eC programming language and supports multiple OGC API specifications. GNOSIS Map Server supports multiple encodings including GNOSIS Map Tiles (which can contain either vector data, gridded coverages, imagery, point clouds or 3D meshes), Mapbox Vector Tiles, GeoJSON, GeoECON, GML and MapML. An experimental server is available online at <https://maps.ecere.com/ogcapi> and has been used in multiple OGC Innovation Program initiatives.

4.3.4. Hexagon Luciad RIA

LuciadRIA is a product that enables applications running in a web browser to offer 2D, 3D, or 4D visualization of satellite and other imagery, vector-based data and dynamic content, such as tracks. LuciadRIA can connect to implementations of OGC API Standards, as well as implementations of OGC Web Service standards.

5

RESULTS

RESULTS

The code sprint included multiple software products and implementations of OGC and ISO Standards. This section presents some of the results from the code sprint.

5.1. MariaDB CubeWerx CubeSERV

Developers from MariaDB configured an instance of their CubeSERV product to offer an OGC API – Maps interface in front of a WMS that was serving EuroGeographics's EuroRegionalMap. A screenshot of the CubeSERV user interface is shown in Figure 2. The user interface lists the coordinate reference systems that are supported by the collection that is being retrieved.

The screenshot shows a web-based application interface for the EuroRegionalMap collection. At the top, there is a header bar with navigation icons (back, forward, search) and the URL test.cubewerx.com/cubewerx/cubeserv/demo/ogcapi/EuroRegionalMap/collections/erm. Below the header is a blue header bar with the title "EuroRegionalMap". The main content area has a light gray background. It displays a map of Europe with coastlines and major rivers. To the right of the map, there is a section titled "WGS 84 Geographic Extent:" with the following coordinates:

- Minimum Latitude: -80
- Minimum Longitude: -180
- Maximum Latitude: 85
- Maximum Longitude: 180

Below the map, there is a checkbox labeled "show context layer". Under the "Coordinate Reference Systems" section, it says: "The native coordinate reference system of this collection is: [WGS 84 \(CRS84\)](#) (<http://www.opengis.net/def/crs/OGC/1.3/CRS84>)". It also lists other available CRSes:

- [WGS 84](#) (<http://www.opengis.net/def/crs/EPSG/0/4326>)
- [WGS 84 / Pseudo-Mercator](#) (<http://www.opengis.net/def/crs/EPSG/0/3857>)
- [WGS 84 / World Mercator](#) (<http://www.opengis.net/def/crs/EPSG/0/3395>)
- [NAD27](#) (<http://www.opengis.net/def/crs/EPSG/0/4267>)
- [NAD27 \(CRS27\)](#) (<http://www.opengis.net/def/crs/OGC/1.3/CRS27>)
- [NAD83](#) (<http://www.opengis.net/def/crs/EPSG/0/4269>)
- [NAD83 \(CRS83\)](#) (<http://www.opengis.net/def/crs/OGC/1.3/CRS83>)
- [NAD83\(CRS\) / SCoPQ zone 2](#) (<http://www.opengis.net/def/crs/EPSG/0/2944>)
- [NAD83\(CRS\) / MTM zone 3](#) (<http://www.opengis.net/def/crs/EPSG/0/2945>)
- [NAD83\(CRS\) / MTM zone 4](#) (<http://www.opengis.net/def/crs/EPSG/0/2946>)

Below the CRS list, there is a link "(expand to show entire list)". Under the "Links" section, it says: "The following resources are available for this collection:" followed by a bulleted list:

- [this collection as JSON](#)
- [this collection as XML](#)
- [the available styles for this collection, with links to style-specific map layers and tiles](#)
- [a map layer of this collection \(accepts query parameters for subsetting, etc.\)](#)
- [map tiles of this collection, in the collection's default style](#)

Figure 2 – Screenshot of CubeSERV describing a collection

The styles that are supported by the collection can also be accessed, as demonstrated in Figure 3.

The screenshot shows a web browser window with the URL test.cubewerx.com/cubewerx/cubeserv/demo/ogcapi/EuroRegionalMap/collections/erm/styles. The page title is "EuroRegionalMap - Styles". A sub-header says "The following styles are available for this collection:". Below it, a "default" style is selected, indicated by a blue background. The "Style ID: default" section contains a thumbnail image of a map showing Europe with blue regions, a "Legend:" link, and a "Map" link. A "Links:" section lists several options: "this collection-specific style as JSON", "this collection-specific style as HTML", "a map layer of this collection in this style (accepts query parameters for subsetting, etc.)", "map tiles of this collection in this style", and "a legend graphic depicting this map layer in this style". At the bottom, a copyright notice reads "© 2022 MariaDB. All rights reserved. Version 9.5.9."

Figure 3 – Screenshot of CubeSERV describing styles supported by the collection

The supported map tiles can also be retrieved. A screenshot describing part of a supported tile matrix set is shown in Figure 4.

test.cubewerx.com/cubewerx/cubeserv/demo/ogcapi/EuroRegionalMap/collections/erm/styles/default/map/tiles/euro_3857

EuroRegionalMap - euro_3857 Map Tiles For Style "default"

This is a set of map tiles for collection "EuroRegionalMap" in tile-matrix set "euro_3857", rendered in style "default".

The individual tiles can be requested by replacing the `{tileMatrix}`, `{tileRow}` and `{tileCol}` variables in the following URL template:

`https://test.cubewerx.com/cubewerx/cubeserv/demo/ogcapi/EuroRegionalMap/collections/erm/styles/default/map/tiles/euro_3857/{tileMatrix}/{tileRow}/{tileCol}`

The tile format can be negotiated with the HTTP "Accept" header or requested explicitly with an "f" query parameter. The following tile formats are supported:

PNG image (image/png)

Tile-Matrix Set

Title: euro_3857

Coordinate Reference System: WGS 84 / Pseudo-Mercator (<http://www.opengis.net/def/crs/EPSC/0/3857>)

Zoom Levels

The following `{tileMatrix}` zoom levels are available:

5.2. GNOSIS Map Server

TBA

5.3. Leaflet

5.3.1. OGC API – Tiles implementation

Leaflet has built-in support for map tiles (or “TileLayer”s), but its internal implementation has significant constraints: All TileLayers must share the same coordinate system, must be aligned to the same origin of coordinates, and all tiles in any given TileLayer must have the same pixel size.

The flexibility of OGC API – Tiles in regards of tile size and origin of coordinates both prove a handicap for a Leaflet client implementation.

The reached consensus is to ignore TileMatrixSets which do not have a constant tile size, or that do not have a common origin of coordinates for the (0,0) tiles.

5.3.2. OGC API – Maps implementation

An instance of leaflet was configured to access an OGC API – Maps implementation from a MariaDB CubeSERV instance. The CubeSERV instance had been configured to offer an OGC API – Maps façade in front of a WMS that offered layers of the EuroRegionalMap of EuroGeographics. A screenshot of the leaflet instance is shown in Figure 5.

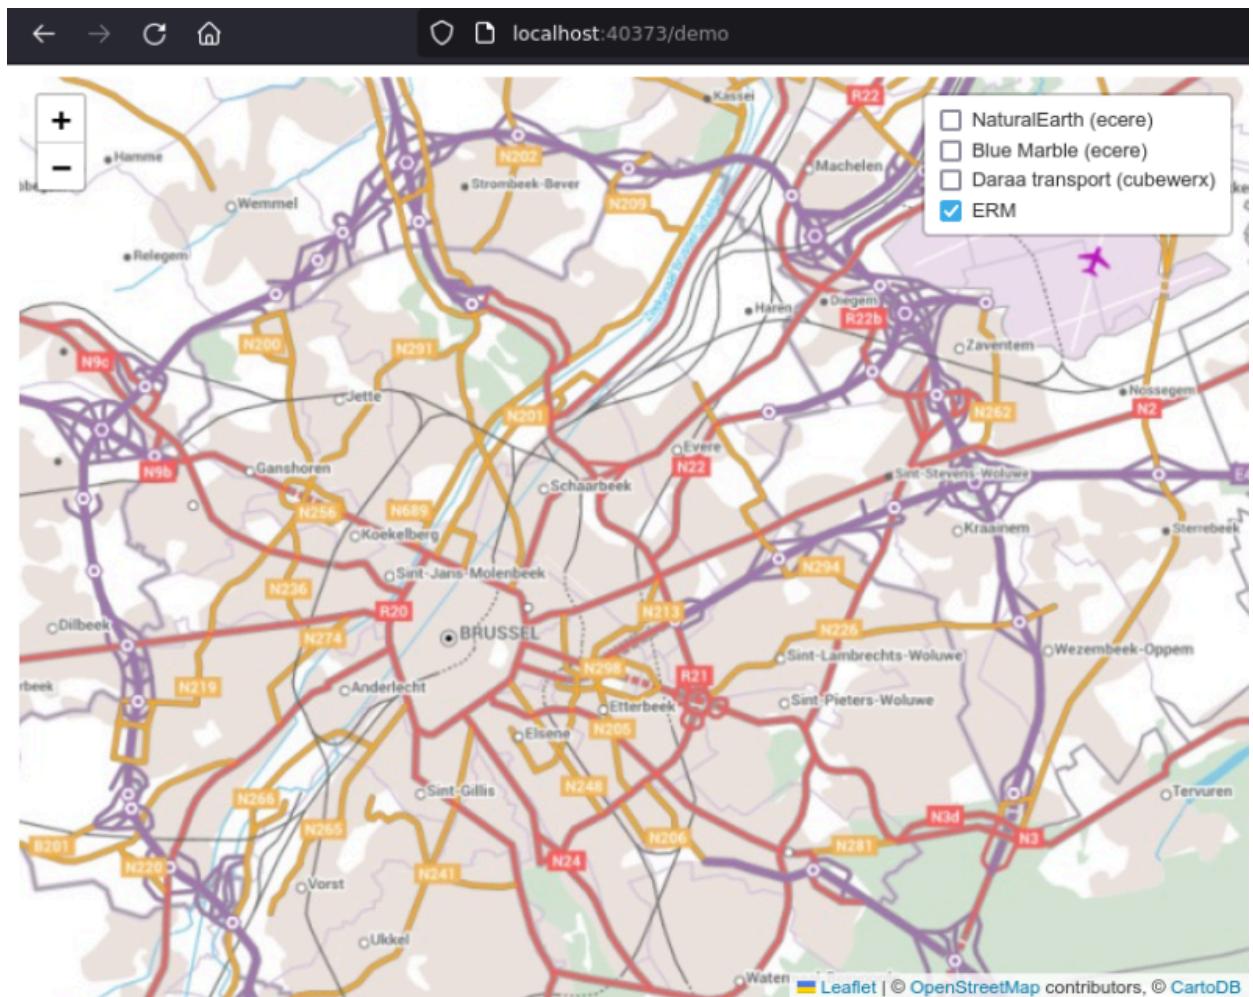

Figure 5 – Screenshot of leaflet accessing a CubeSERV implementation of OGC API - Maps.

5.6. Miramon Map Browser

TBA

5.7. Ordnance Survey Implementation of OGC API – Styles

Have implemented a managed styles mechanism.

In terms of being able to post styles to the server.

The prototype implements support for Mapbox Vector Tiles.

5.8. OGC Styles and Symbology

A breakout session on OGC Styles and Symbology discussed potential Conformance Classes for a new OGC Styles and Symbology Standard.

The sprint participants went through the conformance classes to check that none were missing, and found that some were indeed missing. An example of a conformance class that was missing is the Geometry Selection conformance class in relation to the possibility of a symbolizer accessing the underlying geometry to manipulate it. Such a capability could be applied to visualisation of proportional symbols, for example, transforming a polygon into a point with ST-Centroid to draw a proportional symbol.

As several SWG members participants in the breakout session, the discussions will help to move towards a version 2.0 “Styles & Symbology Model & Encodings” that includes SymCore and the conceptual/logical definitions of the concrete extensions. The sprint participants started the documentation of the envisaged version 2.0 on GitHub.

In parallel, the sprint participants worked on relevant use cases to test the functional coverage of the proposed model and to relate them to the conformance classes. The use cases are presented in Annex A. In doing so, the sprint participants tested existing encodings (e.g. GeoCSS) to start imagining the “natural” encoding that could also be documented with Part 1 of the “Styles & Symbology Model & Encodings” candidate standard.

5.9. OWSLib

The OWSLib project implemented client capability for the OGC API – Records – Part 1: Core draft specification. Support for the “Requirements Class “Map Core” was implemented, reviewed and approved by the OWSLib development team. As a result, Python clients can now use OWSLib for simple Pythonic workflows to request and visualize data from an OGC API – Maps service.

A screenshot of a sample Python/OWSLib workflow of the new functionality is shown in the figure below.

```
from owslib.ogcapi.maps import Maps
m = Maps('http://localhost:5000')
euroglobalmap = m.collection('euroglobalmap')
data = m.map('euroglobalmap',
             width=1200,
             height=800,
             bbox=[4.022369384765626, 50.690447870569436, 4.681549072265626, 51.00260125274477],
             bbox_crs='http://www.opengis.net/def/crs/EPSG/0/3857',
             transparent=True)
with open("output.png", "wb") as f:
    f.write(data.getbuffer())
```

Figure 6 – Screenshot of a sample Python/OWSLib workflow

A screenshot of the OWSLib OGC API – Maps demo is shown below.

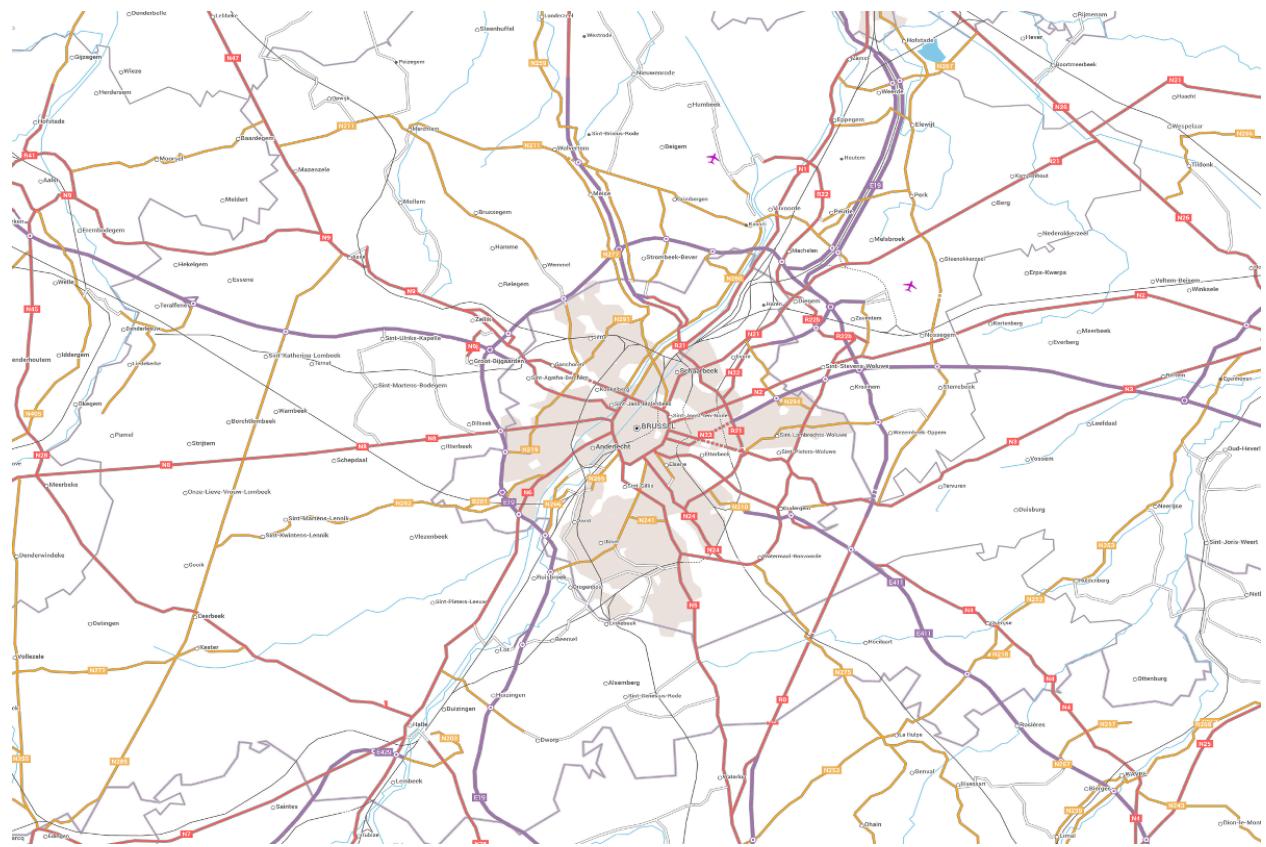

Figure 7 – Screenshot of the OWSlib OGC API – Maps demo

5.10. pygeoapi

5.10.1. OGC API – Maps implementation

The pygeoapi project implemented support for the OGC API – Maps – Part 1: Core draft specification. Support for the Requirements Class “Map Core” was implemented, reviewed and approved by the pygeoapi development team. As a result, pygeoapi implementations are now able to easily publish geospatial data as dynamic maps thanks to the building block approach of OGC API Standards.

pygeoapi’s plugin architecture facilitated the implementation of two plugin backends for maps:

- MapScript: using the MapServer[<https://mapserver.org>] web mapping engine as the map renderer, using data and styling definitions (Styled Layer Descriptor [SLD], MapServer CLASS configuration files).
- WMSFacade: a bridge/mediator to expose existing OGC WMS 1.3 services via OGC API – Maps

The [official pygeoapi documentation](#) provides more information on how to enable the new functionality. A screenshot of the associated OpenAPI/Swagger interface from the implementation is shown in the figure below.

MapScript

MapScript is MapServer's scripting interface to map rendering.

To publish a map via MapScript, the path to data is required, as well as the layer type (*options.type*). To style the data, set *options.style*. If no style is specified, the layer will be rendered with defaults.

MapServer layer types (*options.type*):

`MS_LAYER_POINT`

`MS_LAYER_LINE`

`MS_LAYER_POLYGON`

`MS_LAYER_RASTER`

Currently supported style files (*options.style*):

OGC Styled Layer Descriptor (SLD)

MapServer CLASS includes (i.e. file snippets with CLASS definitions)

```
providers:  
  - type: map  
    name: MapScript  
    data: /path/to/data.shp  
    options:  
      type: MS_LAYER_POINT  
      layer: foo_name  
      style: ./foo.sld  
    format:  
      name: png  
      mimetype: image/png
```

Figure 8 – Screenshot of pygeoapi OGC API – Maps MapScript plugin

WMSFacade

To publish a WMS via pygeoapi, the WMS base URL (*data*) and layer name (*options.layer*) is required. An optional style name can be defined via *options.style*.

```
providers:  
  - type: map  
    name: WMSFacade  
    data: https://demo.mapserver.org/cgi-bin/msautotest  
    options:  
      layer: world_latlong  
      style: default  
    format:  
      name: png  
      mimetype: image/png
```

Figure 9 – Screenshot of pygeoapi OGC API – Maps WMSFacade plugin

GET /collections/land_shallow_topo_2048/map Get map

Blue Marble map

Parameters

Name	Description
bbox <small>array[number] (query)</small>	Only features that have a geometry that intersects the bounding box are selected. The bounding box is provided as four or six numbers, depending on whether the coordinate reference system includes a vertical axis (height or depth): <ul style="list-style-type: none"> Lower left corner, coordinate axis 1 Lower left corner, coordinate axis 2 Minimum value, coordinate axis 3 (optional) Upper right corner, coordinate axis 1 Upper right corner, coordinate axis 2 Maximum value, coordinate axis 3 (optional) If the value consists of four numbers, the coordinate reference system is WGS 84 longitude/latitude (http://www.opengis.net/def/crs/OGC/1.3/CRS84) unless a different coordinate reference system is specified in the parameter bbox-crs .
width <small>integer (query)</small>	Response image width
height <small>integer (query)</small>	Response image height
transparent <small>boolean (query)</small>	Background transparency of map (default=true).
bbox-crs <small>integer (query)</small>	Indicates the EPSG for the given bbox coordinates.
f <small>string (query)</small>	The optional f parameter indicates the output format which the server shall provide as part of the response document. The default format is GeoJSON.

Execute **Clear**

5.10.2. OGC API – Tiles updates

5.10.2.1. Tile Metadata

Support for the Tile Set Metadata schema has been added to TileJSON MapBox. It is also possible to support any format by adding a JSON metadata file directly into the filesystem. As well, the absence of metadata does not represent an issue, facilitating support for different tiles providers.

```

Figure 12

5.10.2.2. Vector tiles URL templates

pygeoapi added support for rendering OGC API – (vector) tiles from a third-party service, using a generic URL template. One use case for this functionality would be to stream [elasticsearch vector tiles](#), which are provided in elasticsearch >=8, as OGC API – Tiles.

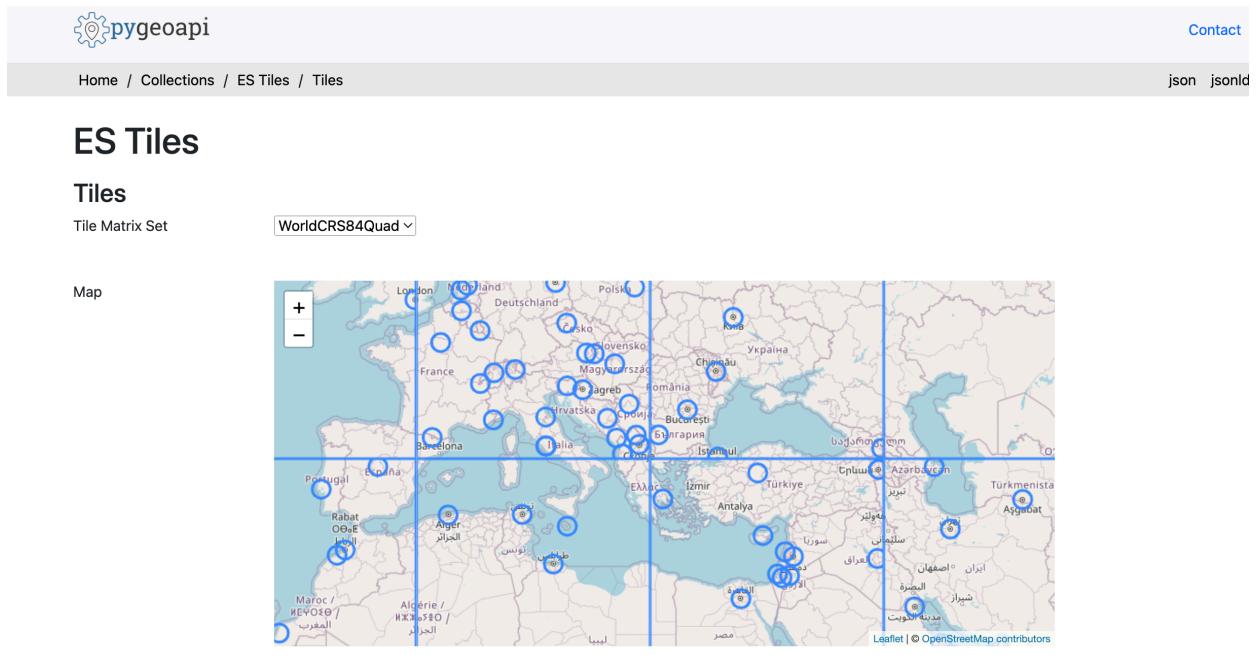

Figure 13 – Screenshot of pygeoapi OGC API – Tiles using the Elasticsearch vector tiles

We could also use this functionality to render [pg_tileserv](#) vector tiles, or any other service which uses format {z}/{y}/{x} or {z}/{x}/{y}

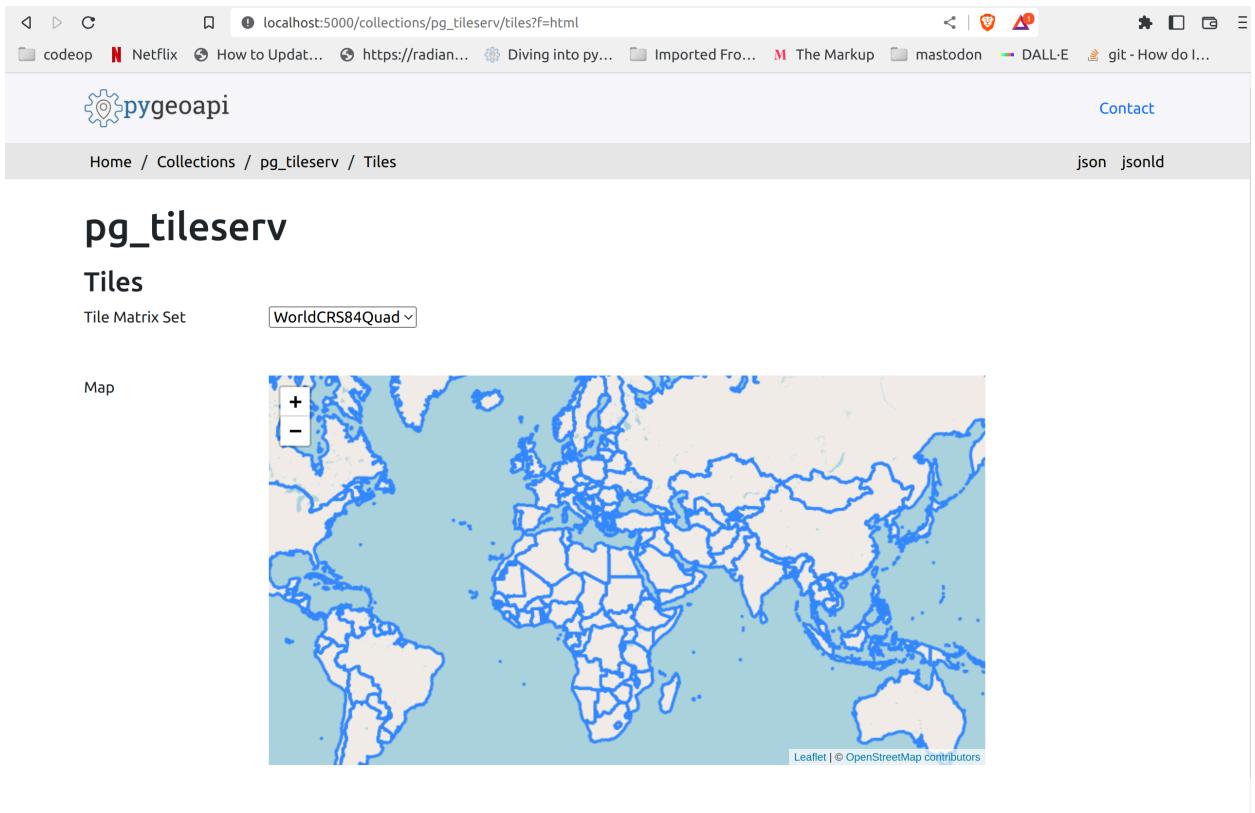

Figure 14 – Screenshot of pygeoapi OGC API – Tiles connecting to a pg_tileserv vector tiles service

5.10.3. OGC API – Coverages browser rendering

pygeoapi gained HTML representation of a coverages, as a lightweight HTML viewer.

This viewer is a Leaflet[<https://leafletjs.com/>] implementation, which uses the Leaflet.ImageOverlay.Arrugator[<https://gitlab.com/IvanSanchez/Leaflet.ImageOverlay.Arrugator/>] plugin, and the proj4js[<https://github.com/proj4js/proj4js/>] library to provide client-side reprojection. Whenever a web browser visits a /coverage path on pygeoapi, the web browser sends an Accept: text/html header which triggers pygeoapi to respond with the lightweight coverage viewer.

Figure 15 – Screenshot of pygeoapi lightweight coverage viewer

The emphasis is not in the viewer, but rather in the fact that the viewer is the HTML representation of the coverage resource. Whenever a API client requests the coverage resource, it will be given a HTML map viewer, or the JSON-LD representation of the coverage, or the raw

coverage data (as PNG, GeoTIFF, NetCDF, etc), in accordance to the established HTTP content negotiation rules (“Accept” HTTP headers, or “f” URL parameter).

This is aligned with pygeoapi’s implementation of OGC API – Features, where requesting features as HTML returns a map viewer loaded with those features.

5.10.4. Mentor session

A pygeoapi mentor session was provided in support of delivering Vector Tiles using pygeoapi. The session focused on:

- installation
- overview of various endpoints and Creating standard source
- creating vector tiles
- serving vector tiles
- reading vector tiles from different clients

5.10.5. Developer outreach

Members of the pygeoapi development team discussed project participation and contributions with various developers at the sprint.

DISCUSSION

6.1. JPEG or PNG responses

JPEG images are typically an order of magnitude smaller in byte size than PNG images of a similar width and height in pixels. JPEG images therefore result in a much more responsive experience, but they do not support transparency, so layer overlays are impossible. PNG images, on the other hand, do support transparency, but are typically larger in byte size for a similar width and height in pixels. Some client implementations deal with this by requesting the bottom layer as JPEG and all overlay layers as PNG, but this is far from ideal. One somewhat common solution is to support a “JPEG or PNG” format (represented by a requested content type of “image/x-jpegorpng” or “image/jpgpng” or a format string of “jop”). When this format is requested, the server can return the requested image in the optimal image format (typically PNG if there’s transparency and JPEG otherwise). Several implementations, including CubeSERV, have taken this approach, and it has proven to be a highly effective optimization. However, the WMS and WMTS specifications failed to standardize such a request format, so this optimization isn’t interoperable.

This is not an issue for the “OGC API – Maps” and “OGC API – Tiles” Standards, since they support format (i.e., content type) negotiation through use of the HTTP Accept request header. A client can simply indicate `Accept: image/png, image/jpeg`, which literally means “give me whichever of these two formats you consider the most appropriate”. And as a bonus, a typical web browser will send an `Accept` string which gives `image/jpeg` and `image/png` equal weighting, so JPEG-or-PNG negotiation can automatically occur even through simple web-browser requests. It should be noted that some modern web browsers send an `Accept: image/avif, image/webp, /`` header, which suggests that they prefer some of the newer formats which also happen to support an alpha channel. Therefore, use of the `Accept` header as already implemented by OGC API Standards also enables support for other encoding options.

However, there is a concern that most implementers of the “OGC API – Maps” and “OGC API – Tiles” Standards might not recognize the importance of this logic, and would likely write code which just chooses the first supported format in the list. There is therefore a need for awareness of this mechanism because such a mechanism is important enough to be explicitly provided as a recommendation in both the “OGC API – Maps – Part 1: Core” and “OGC API – Tiles – Part 1: Core” Standards.

A Recommendation could be added to an OGC API – Maps User Guide or some other developer resource. The sprint participants suggested that the SWG considers the following text for addition to a User Guide:

- If both “`image/png`” and “`image/jpeg`” are supported at an endpoint and are present in the HTTP “`Accept`” request header with the same `q` value, and no other supported output format is present with a higher `q` value, the server should return the requested

image in whichever of these two formats is considered optimal (typically PNG if there's transparency and JPEG otherwise).

Regarding the "f" parameter, if servers implement an "f" parameter that overrides the HTTP "Accept" request header, the servers would have the option of supporting custom values such as "jop" or "image/x-jpegorgpng" which would trigger the optimization. However, since "jop" or "image/x-jpegorgpng" are not standardized parameter values for indicating an encoding, the Standards need not provide any recommendations to this effect.

6.2. Data Statistics

Many clients have the need to retrieve a **feature count** element from the server, in order to construct their visualizations. OGC API – Features addresses this need through a property called "numberMatched" when a feature collection is retrieved. However, this leads clients sometimes to issue two separate get items requests: one to count the items, and another one to actually draw them.

There's a parallel with OGC API – Coverages: one of the use cases is fetching the coverage metadata (width, height, dimensions (2-3), bit depth, time dimension, number of channels/bands, native CRS) but not the data itself. That's how the pygeoapi viewer implementation works as of now.

OGC API – Tiles addresses this issue by offering tile set metadata and TileMatrixSet definitions. However, a similar ability to retrieve data statistics without retrieving the data appears to be missing from OGC API – Features and OGC API – Coverages.

The sprint participants suggested that a super class for presenting data statistics could be specified in OGC API – Common and then specialised in other OGC API Standards.

6.3. Cancel Requests

When requesting tiles, and panning around, clients often leave behind requests from tiles which are no longer in the viewport. This has a performance cost, as the server gets overloaded with requests which are no longer needed. One way of handling this situation, would be to fire a cancel request, for tiles which are no longer in the viewport. Some popular browsers, such as Mozilla Firefox, support this capability through the [XMLHttpRequest.abort\(\)](#) method.

The sprint participants suggested the following as recommendations:

- Clients should be able to send a cancel or abort request so that a server aborts a long-running operation.

- Clients for OGC API – Maps should make a best effort to avoid making several requests in short periods of time (e.g. 1 second)
- Servers for OGC API – Maps can reply with HTTP code 429 Too Many Requests if a client is straining the server resources

6.4. Security/access control

The EuroGeographics WMS access token as applied in OGC API – Maps via pygeoapi brought forth questions about how cascading / broker services deal with secure services. The pygeoapi documentation provides an overview on [security and access control](#). The September 2020 OGC API Code Sprint included a security thread OGC 20-091, however since then there has not been a similar thread in OGC Code Sprints. There was a suggestion to have a sprint (or thread in same) focused on general security/access control issues, across OGC API and broader OGC standards. There are several implementations of OGC API Standards that implement access control mechanisms. Such a code sprint could pull in lessons learnt from many of the OGC API implementations that support access control, for example Ordnance Survey's [NGD API – Features](#), NLS Finland's [Topographic Database](#), and those from the [OGC Testbeds](#) OGC 21-020r1.

6.5. Filtering of styles

There was a discussion about whether it is possible to filter styles returned by an implementation of OGC API – Styles, in a standardised way. Currently, just like with OGC API – Features, a client simply receives a list of collections without the ability to filter the collections according to a specific criteria. There have been suggestions that all collections should have the ability to be filtered. This would support the ability to filter on a particular field, such as the description. A client would only get the list of styles that are relevant to that filter. Whereas it is possible to do, at present this capability is not standardised.

6.6. HTML Previews

There was a discussion about the retrieval of HTML previews of data from an OGC API implementation. This followed the work described in Clause 5.10.3 regarding a coverage viewer for pygeoapi. It was noted that the ability to request an HTML representation of a dataset means that an OGC API could potentially also offer support for querying a dataset through a web browser. This leaves the question of how a query language such as CQL2 could be applied to tile matrix sets. Further, the HTML Preview capability creates an opportunity to enable the actual data to be queried such that the value of a location on a coverage can be retrieved rather

than the RGB (Red-Green-Blue) values of the image that is presented. The sprint participants noted that this could be a topic for a testbed or another type of innovation initiative.

Another topic discussed in relation to HTML Previews was that the Accept header or “f” parameter indicated the format of the response payload, but not the format of any embedded elements. So there is an expectation that the web browser supports whichever image format is embedded in the HTML response of the API. One option is to introduce a recommendation that if one of the media types is text/html, and the other is an image, then the server should return an HTML Preview that contains an image in the format specified. The sprint participants also noted that HTML offers a <picture> element which contains an element, as well as zero or more <source> elements that offer alternative versions of an image for different situations HTML. A web browser considers each <source> element and selects the most appropriate among them. If there are no appropriate options, the web browser uses the URL in the src attribute of the element is selected.

7

CONCLUSIONS

CONCLUSIONS

TBA

7.1. Future Work

The sprint participants made the following recommendations for future innovation work items:

- Prototyping and demonstration of support for the querying of coverages in HTML
Previews of coverage tiles
- TBA
- TBA

The sprint participants also made the following recommendations for things that the SWGs should consider:

- A code sprint focused on general security/access control issues, across OGC API and broader OGC standards
- TBA
- TBA

It is envisaged that the SWGs will consider the above-listed recommendations for future work items.

A

ANNEX A (INFORMATIVE) STYLES AND SYMBOLOLOGY USE CASES

ANNEX A (INFORMATIVE) STYLES AND SYMBOLOLOGY USE CASES

This annex presents the Styles and Symbology use cases that were discussed and documented during the code sprint.

A.1. Graduated and Categorized: conditional coloring of a map

This use case is discussed in [styles-and-symbology#Issue 17](#).

Existing conformance classes required for this use case:

- Symbology Core: Class Symbolizer
- Example stylesheet:

Describe any capability not already addressed by existing conformance classes:

- Categorized: coloring map according to a unique value eg. coloring map according to region name (unique value)
- Graduated: coloring map according to a range of values eg. coloring map according to the population of a zone in a particular range(0-5000, 5000-10000)

Example image illustrating the portrayal use case:

- Categorized:

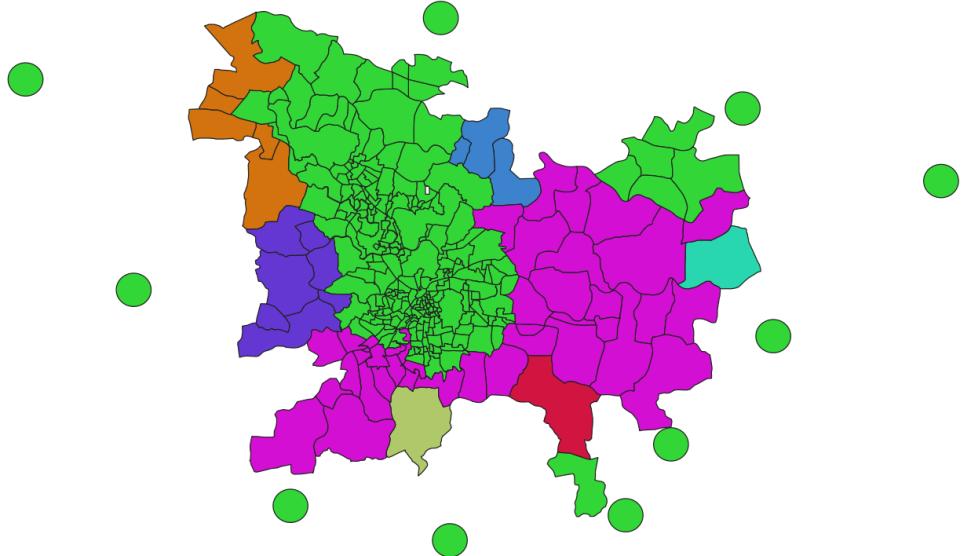

Figure A.1 – Categorized conditional coloring of a map

- Graduated

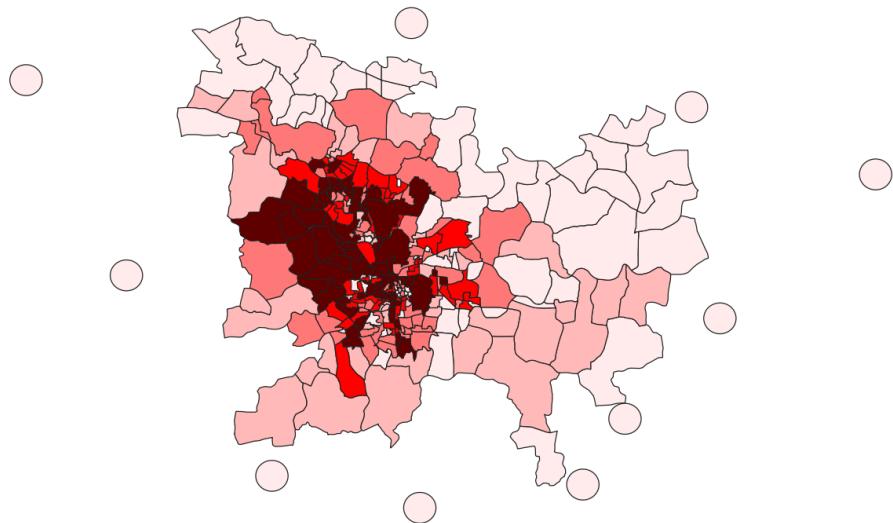

Figure A.2 – Graduated conditional coloring of a map

A.2. Unique values map

This use case is discussed in [styles-and-symbology#Issue 18](#).

Existing conformance classes required for this use case:

- basic vector feature styling

Example stylesheet:

Below a CSS encoding to describe a unique values map to display Local Climate Zones type (LCZ_PRIMARY property).

```
/* Metadata
* @title Local Climate Zones I
* @abstract Local Climate Zones I
*/
/* Main rule*/
* {
  stroke: rgb(255,255,255);
  stroke-width: 0.26;
/* Styling according to the Local Climate Zones */
/* @title LCZ 1: Compact high-rise */
[LCZ_PRIMARY = 1] {
  fill: rgb(139, 1, 1);
}
/* @title LCZ 2: Compact mid-rise */
[LCZ_PRIMARY = 2] {
  fill: rgb(204, 2, 0);
}
/* @title LCZ 3: Compact low-rise */
[LCZ_PRIMARY = 3] {
  fill: rgb(252, 0, 1);
}
/* @title LCZ 4: Open high-rise */
[LCZ_PRIMARY = 4] {
  fill: rgb(190, 76, 3);
}
/* @title LCZ 5: Open mid-rise */
[LCZ_PRIMARY = 5] {
  fill: rgb(255, 102, 2);
}
/* @title LCZ 6: Open low-rise */
[LCZ_PRIMARY = 6] {
  fill: rgb(255, 152, 86);
}
/* @title LCZ 7: Lightweight low-rise */
[LCZ_PRIMARY = 7] {
  fill: rgb(251, 237, 8);
}
/* @title LCZ 8: Large low-rise */
[LCZ_PRIMARY = 8] {
  fill: #bcbcba;
```

```

};

/* @title LCZ 9: Sparsely built */
[LCZ_PRIMARY = 9] {
    fill: rgb(188, 188, 186);
};

/* @title LCZ 10: Heavy industry */
[LCZ_PRIMARY = 10] {
    fill: rgb(87, 85, 90);
};

/* @title LCZ A: Dense trees */
[LCZ_PRIMARY = 101] {
    fill: rgb(0, 103, 0);
};

/* @title LCZ B: Scattered trees */
[LCZ_PRIMARY = 102] {
    fill: rgb(5, 170, 5);
};

/* @title LCZ C: Bush,scrub */
[LCZ_PRIMARY = 103] {
    fill: rgb(100, 132, 35) ;
};

/* @title LCZ D: Low plants */
[LCZ_PRIMARY = 104] {
    fill: rgb(187, 219, 122);
};

/* @title LCZ E: Bare rock or paved */
[LCZ_PRIMARY = 105] {
    fill: rgb(1, 1, 1);
};

/* @title LCZ F: Bare soil or sand */
[LCZ_PRIMARY = 106] {
    fill: rgb(253, 246, 174);
};

/* @title LCZ G: Water */
[LCZ_PRIMARY = 107] {
    fill: rgb(109, 103, 253);
};

}

```

Figure A.3

Describe any capability not already addressed by existing conformance classes:

Example image illustrating the portrayal use case:

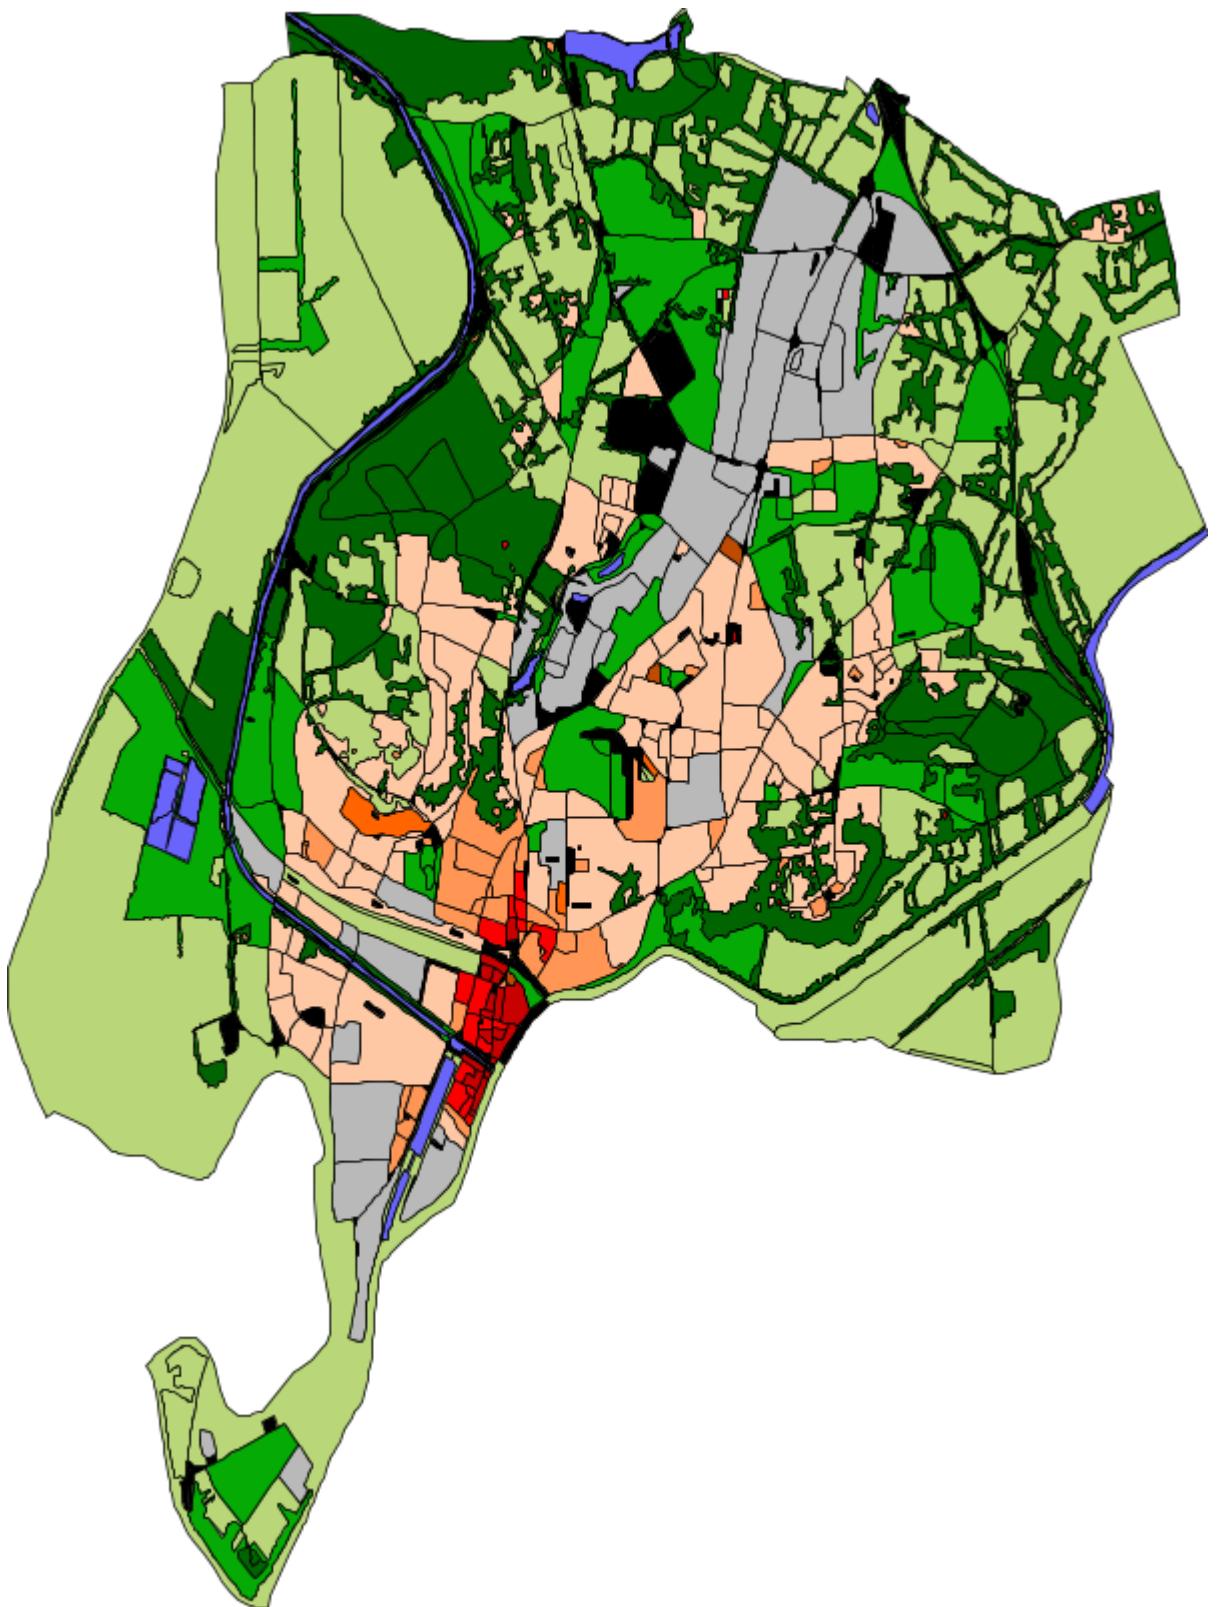

Figure A.4 – Unique values map

Material: Data : https://github.com/orbisgis/POC-Carto/blob/main/data/rsu_lc.z.geojson

A.3. Choropleth or graduated map

This use case is discussed in [styles-and-symbology#Issue 19](#).

Existing conformance classes required for this use case:

- basic vector feature styling

Example stylesheet:

Below a CSS encoding to describe a graduated map to display fraction of vegetation on a grid (HIGH_VEGETATION_FRACTION property).

```
*{
    stroke: #000000;
    stroke-width: 1px;
    [HIGH_VEGETATION_FRACTION]>=0 OR HIGH_VEGETATION_FRACTION<=0.200]
    {
        fill: yellow;
    };
    [HIGH_VEGETATION_FRACTION]>0.200 OR HIGH_VEGETATION_FRACTION<0.500]
    {
        fill: orange;
    };
    [HIGH_VEGETATION_FRACTION]>0.500]
    {
        fill: red;
    };
}
```

Figure A.5

Describe any capability not already addressed by existing conformance classes:

Example image illustrating the portrayal use case:

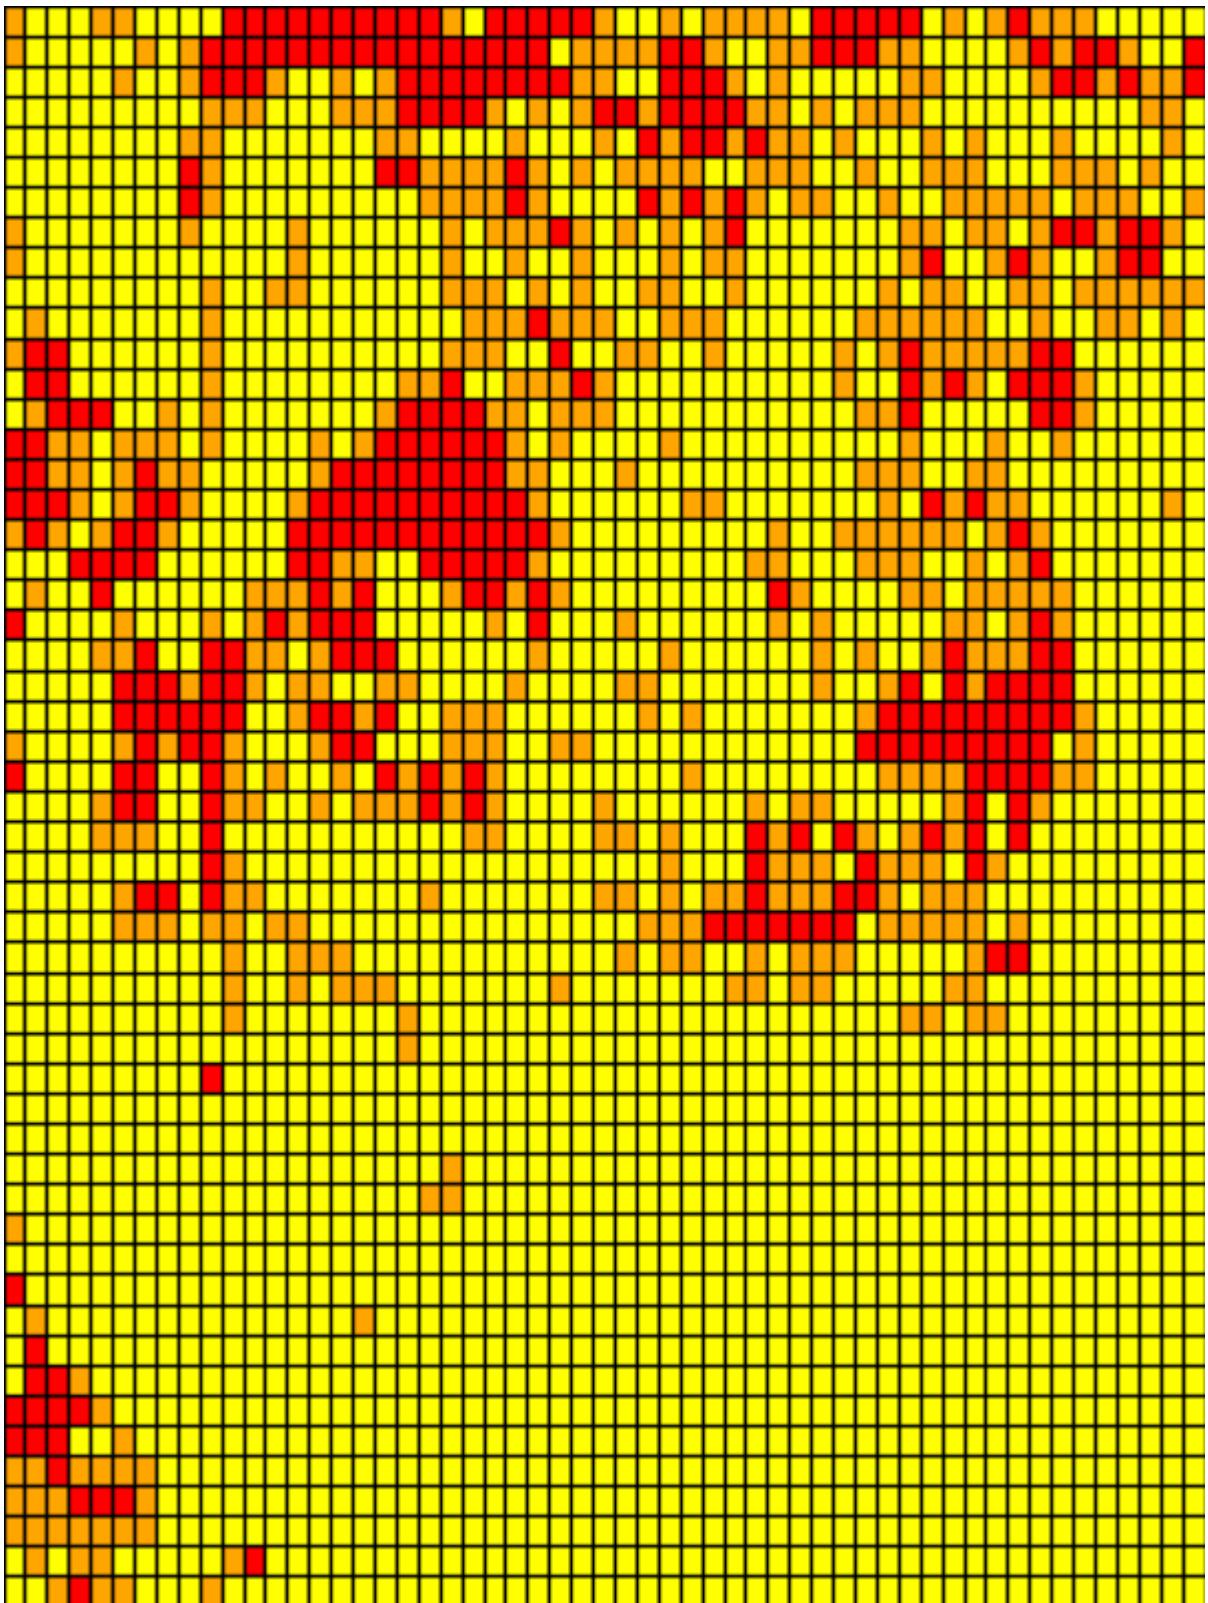

Figure A.6 – Choropleth or graduated map

A.4. Proportional symbol

This use case is discussed in [styles-and-symbology#Issue 20](#).

Existing conformance classes required for this use case:

- vector feature styling
- viz/feature.pass (define conformance classes) #
- geometry selection #
- Geometry Manipulation Functions (centroid #)
- Interpolate function #
- Shape Graphics

Example stylesheet:

Below a CSS encoding to describe a proportional symbol map to display number of inhabitants on a regular grid (SUM_POP property).

```
*{  
  stroke: grey;  
  stroke-width: 1px;  
  [SUM_POP>0] {  
    geometry: centroid(the_geom);  
    mark: symbol(circle);  
    mark-size: [Interpolate(  
      SUM_POP,  
      0, 10,  
      30, 20,  
      84, 100,  
      'numeric',  
      'linear')];  
    :mark {  
      fill: orange;  
      fill-opacity: 0.2;  
      stroke: black;  
      stroke-width : 1px;  
    }  
  }  
}
```

Figure A.7

Describe any capability not already addressed by existing conformance classes:

Example image illustrating the portrayal use case:

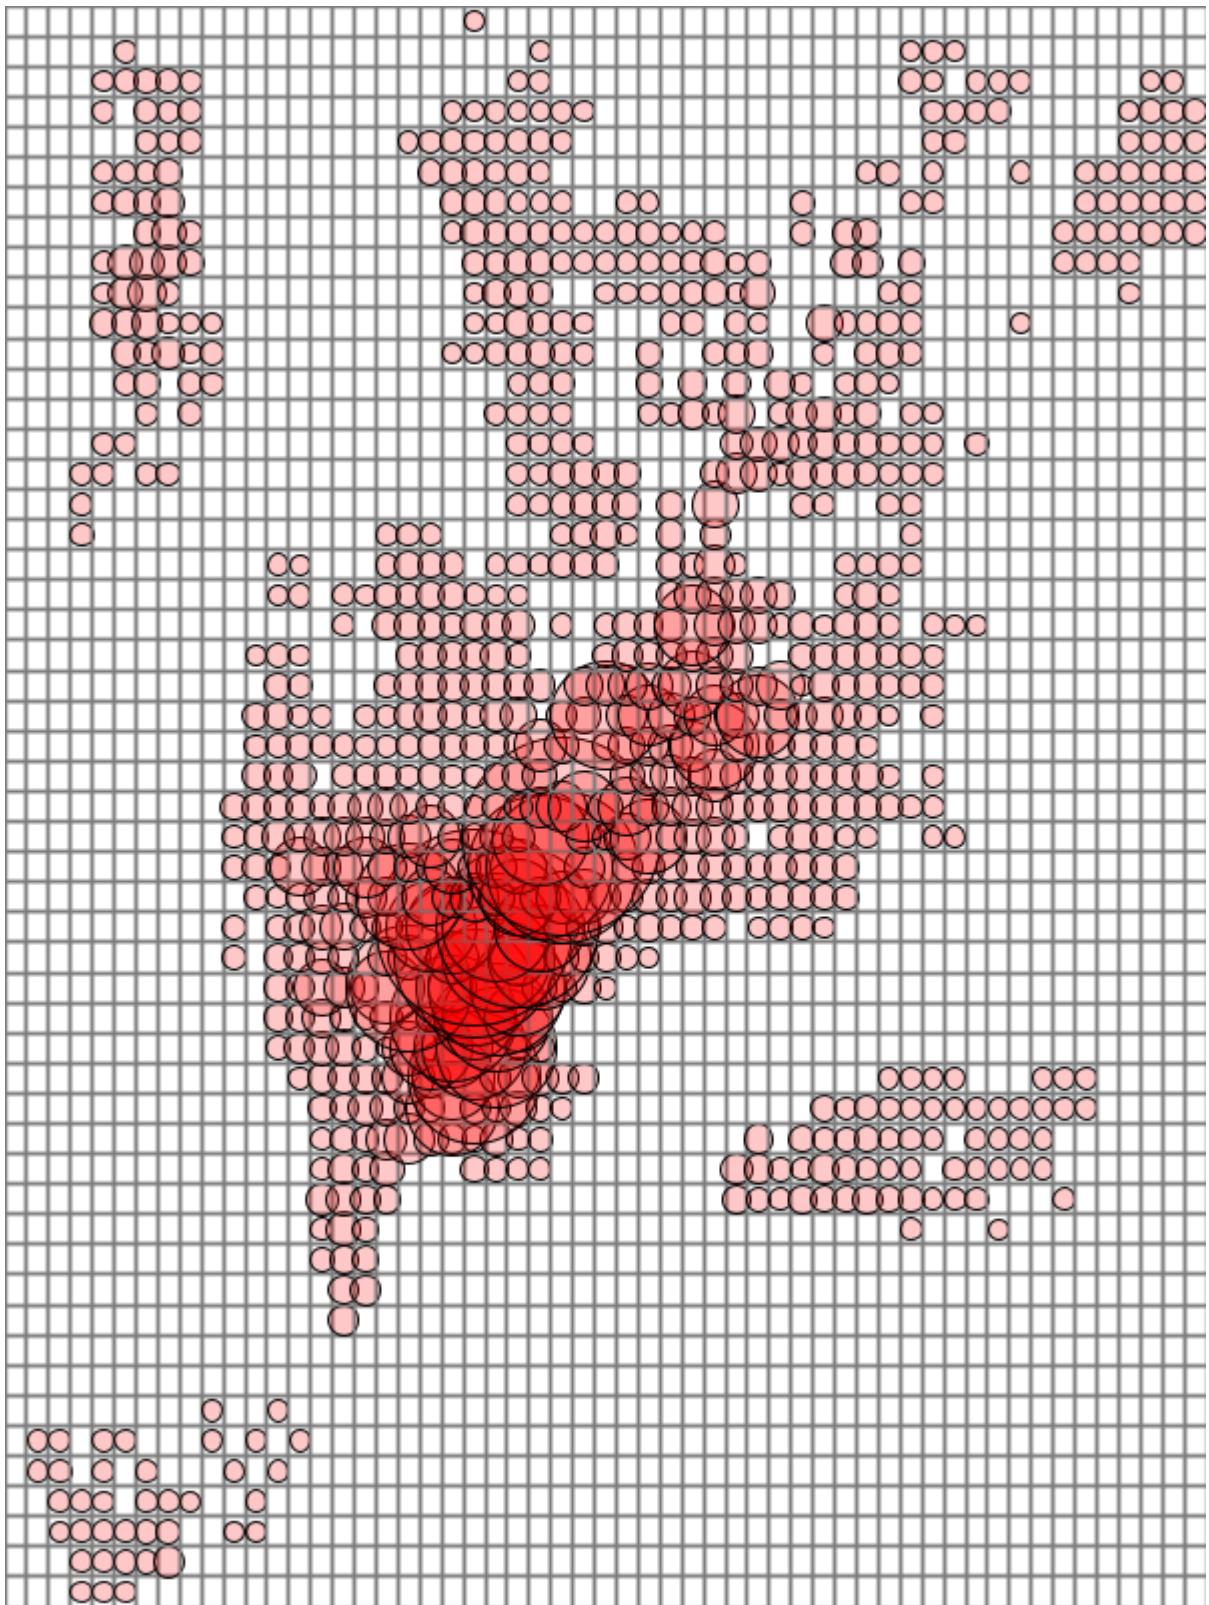

Figure A.8 – Proportional symbol

A.5. Proportional bivariate map

This use case is discussed in [styles-and-symbology#Issue 21](#).

Existing conformance classes required for this use case:

Not specified.

Example stylesheet:

Below a CSS encoding to describe a proportional symbol map with a color for each Local Climate Zones type filtered to represent a climate aleas.

```
*{
  [LCZ_PRIMARY != 104]{
    stroke: grey;
    stroke-width: 1px;
  }
  [SUM_POP>0] {
    geometry: centroid(the_geom);
    mark: symbol(circle);
    mark-size: [Interpolate(
      SUM_POP,
      0, 10,
      30, 20,
      84, 100,
      'numeric',
      'linear')];
  };
  /* @title high climate risk */
  [LCZ_PRIMARY = 1],
  [LCZ_PRIMARY = 2],
  [LCZ_PRIMARY = 3],
  [LCZ_PRIMARY = 10],
  [LCZ_PRIMARY = 105]{
    :mark{
      fill: red;
    }
  };

  /* @title moderate climate risk */
  [LCZ_PRIMARY = 4],
  [LCZ_PRIMARY = 5],
  [LCZ_PRIMARY = 6],
  [LCZ_PRIMARY = 7],
  [LCZ_PRIMARY = 8],
  [LCZ_PRIMARY = 9]{
    :mark{
      fill: orange;
    }
  };

  /* @title low climate risk */
  [LCZ_PRIMARY = 101],
  [LCZ_PRIMARY = 102],
  [LCZ_PRIMARY = 103],
  [LCZ_PRIMARY = 106],
  [LCZ_PRIMARY = 107]{
```

```
:mark{  
    fill: green;  
}  
};  
};
```

Figure A.9

Describe any capability not already addressed by existing conformance classes:

Example image illustrating the portrayal use case:

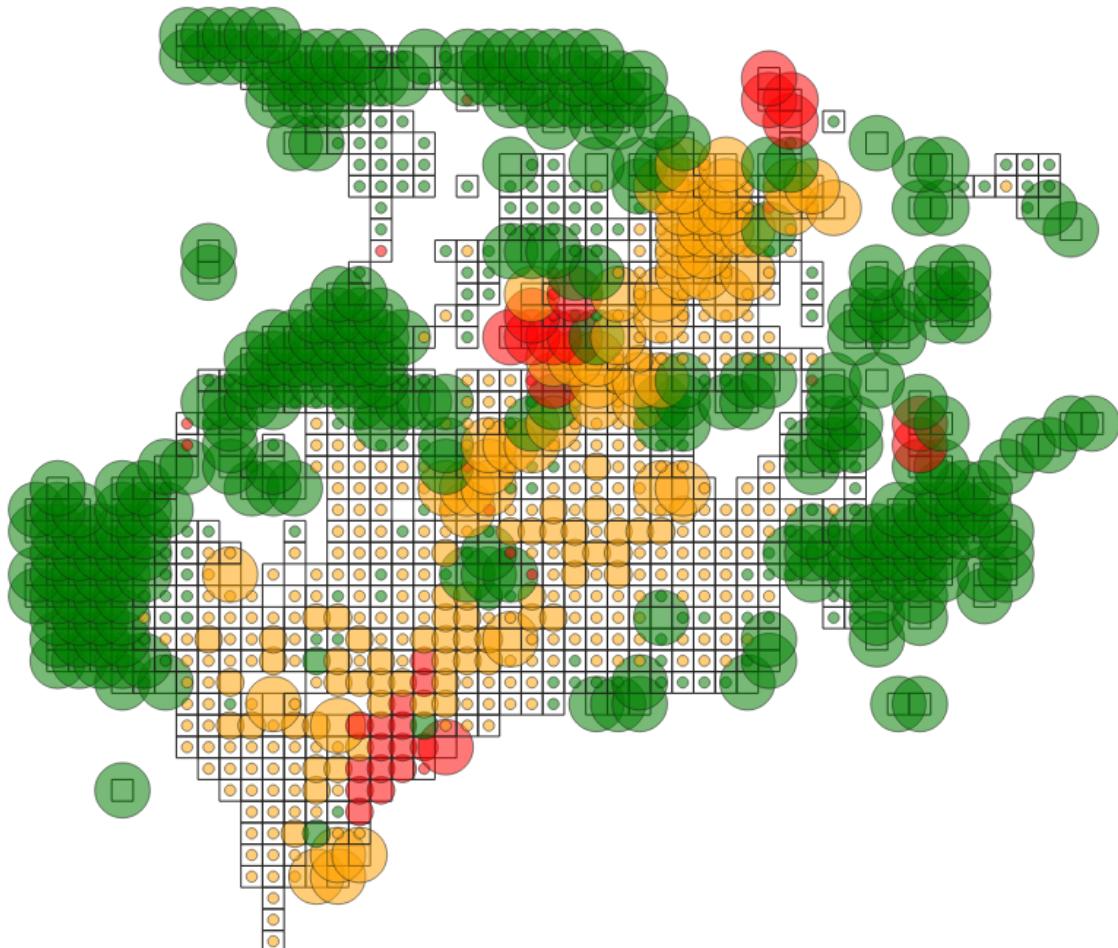

Figure A.10 – Proportional bivariate map

A.6. Dot map density

This use case is discussed in [styles-and-symbology#Issue 22](#).

Existing conformance classes required for this use case:

- Dashes, Stipples, Hatches and Gradients

- (conformance class for more specific stippling)

Example stylesheet:

Below a CSS encoding to describe a dot map. A dot map is used to create a visual impression of density by placing a dot or some other symbol in the approximate location of one or more instances of the variable being mapped. The mapped variable is the area of the LCZ geometry. The dot map can be colored according the LCZ types. a.e : LCZ equals to 1, 2 , 3 filled in red to represent a high climate aleas.

Describe any capability not already addressed by existing conformance classes:

DotFill must be defined with the following properties

- quantityPerMark : the quantity represented by a single dot.
- totalQuantity : the total quantity to be represented.
- mode : the algorithm to distribute the mark random, grid... a mark or a set of marks

Example image illustrating the portrayal use case:

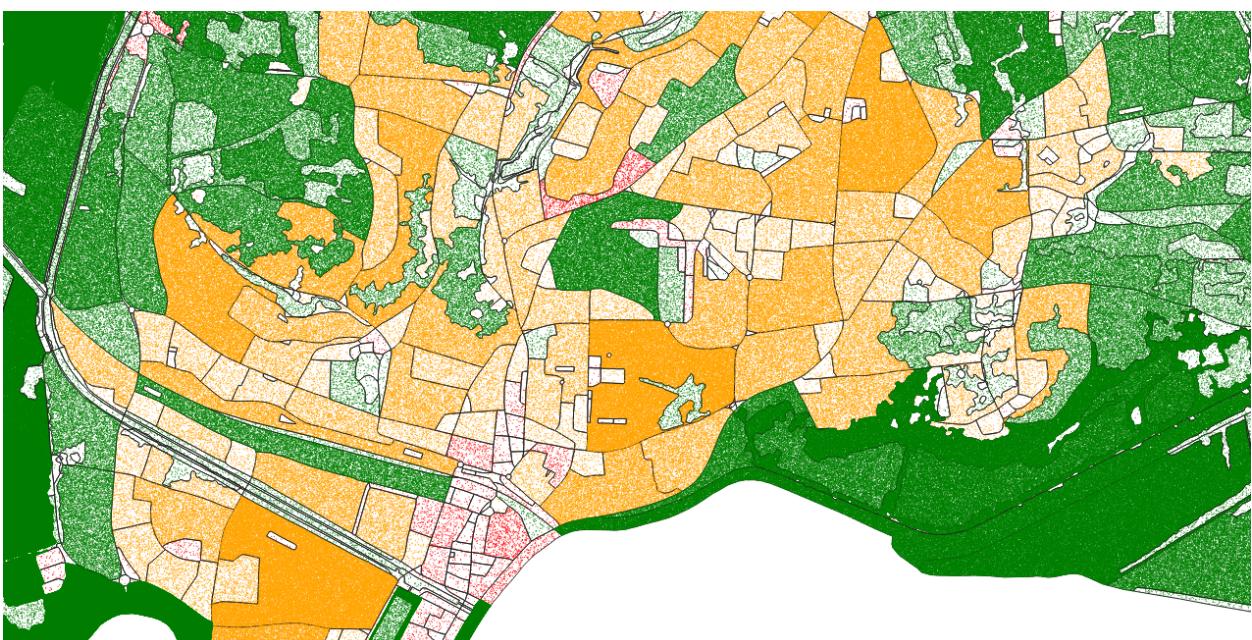

Figure A.11 – Dot map density

A.7. Bivariate proportional symbol

This use case is discussed in [styles-and-symbology#Issue 23](#).

Existing conformance classes required for this use case:

Example stylesheet:

Bivariate map is a technique in cartography to display two different thematic variables at the same time. One of the most common technique to create a bivariate map is to combine of visual variables. For most cartographers it may better support different map reading tasks. The following map uses the same visual variable to represent two variables (Half Circle). It permits a cross-variable comparison between the number of permits in 2005 and 2014.

```
*{
  stroke: grey;
  stroke-width: 1px;
  [NB_PERMITS_2005>0] {
    geometry: centroid(the_geom);
    mark: symbol(semicircle);
    mark-size: [Interpolate(
      NB_PERMITS_2005,
      0, 10,
      659, 100,
      'numeric',
      'linear')];
    :mark {
      fill: rgb(153, 153, 255);
      fill-opacity: 0.2;
      stroke: black;
      stroke-width : 1px;
    }
  };
  [NB_PERMITS_2014>0] {
    geometry: centroid(the_geom);
    mark: symbol(semicircle);
    mark-size: [Interpolate(
      NB_PERMITS_2014,
      0, 10,
      659, 100,
      'numeric',
      'linear')];
    :mark {
      fill: rgb(102, 0, 204);
      fill-opacity: 0.2;
      stroke: black;
      stroke-width : 1px;
      rotation: 180deg;
    }
  }
}
```

Figure A.12

Describe any capability not already addressed by existing conformance classes:

Example image illustrating the portrayal use case:

Figure A.13 – Bivariate proportional symbol

An additional example is presented below.

Figure A.14 – Additional example of Bivariate proportional symbol

A.8. Custom fill

This use case is discussed in [styles-and-symbology#Issue 24](#).

Existing conformance classes required for this use case:

Example stylesheet: The following map shows assembled visual variables expressed with custom fills : Graphic Fill and Hatched Fill.

Describe any capability not already addressed by existing conformance classes:

HatchedFill must be defined with the following properties

- angle : the orientation of the hatches
- distance : the perpendicular distance between two hatches
- offset : the offset of the hatches.
- stroke

Example image illustrating the portrayal use case:

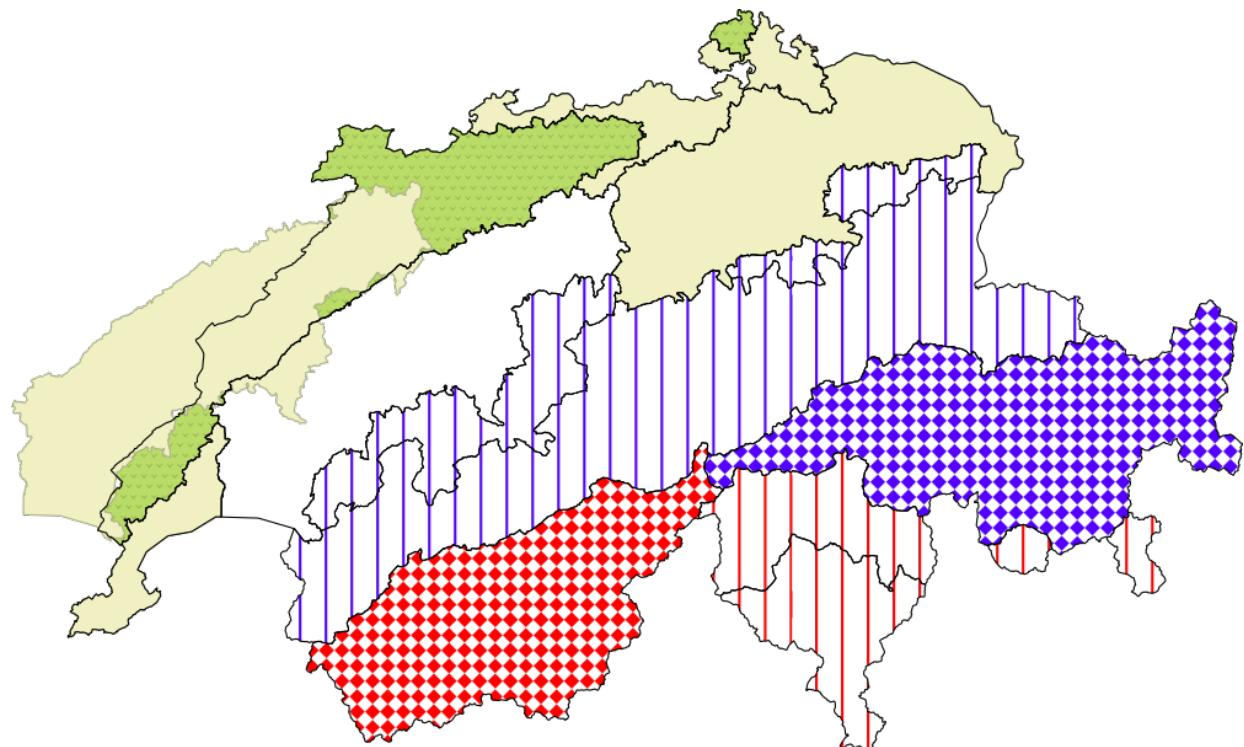

Figure A.15 – Custom fill

An additional example of Custom fill is shown below.

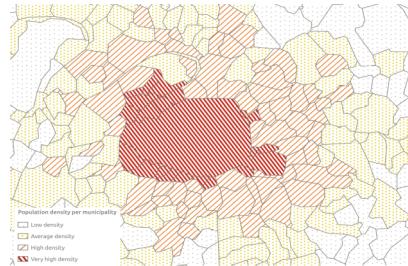

Figure A.16 – Another example of Custom fill

A.9. Proportional colored text

This use case is discussed in [styles-and-symbology#Issue 25](#).

Existing conformance classes required for this use case:

Example stylesheet:

Proportional label map uses the same technique than proportional symbols, expected that the size of the font is scaled proportionately.

Here we describe a CSS file that represents the Local Climate Zone types with a text and a color according a climate aleas.

```
*{
  stroke: grey;
  stroke-width: 0.26;
  label: [LCZ_PRIMARY];
  font-family: Arial;
  font-size: [Interpolate(
    area(geometry)/10000,
    0, 10,
    5, 20,
    10, 32,
    'numeric',
    'linear')];
  font-style: normal;
  font-weight: bold;
  font-fill: black;
  label-anchor: 0.5 0.5;
  label-auto-wrap: 60;
  label-max-displacement: 150;

  /* @title high */
  [LCZ_PRIMARY <= 4],
  [LCZ_PRIMARY = 8],
  [LCZ_PRIMARY = 10],
  [LCZ_PRIMARY = 105] {
    font-fill: red;
  };
  /* @title mid */
  [LCZ_PRIMARY >= 5]
  [LCZ_PRIMARY <= 7],
```

```
[LCZ_PRIMARY = 9],  
[LCZ_PRIMARY = 10] {  
    font-fill :orange;  
};  
/* @title low */  
[LCZ_PRIMARY >= 101]  
[LCZ_PRIMARY <= 104],  
[LCZ_PRIMARY = 107]{  
    font-fill: green;  
}  
}
```

Figure A.17

Describe any capability not already addressed by existing conformance classes:

Example image illustrating the portrayal use case:

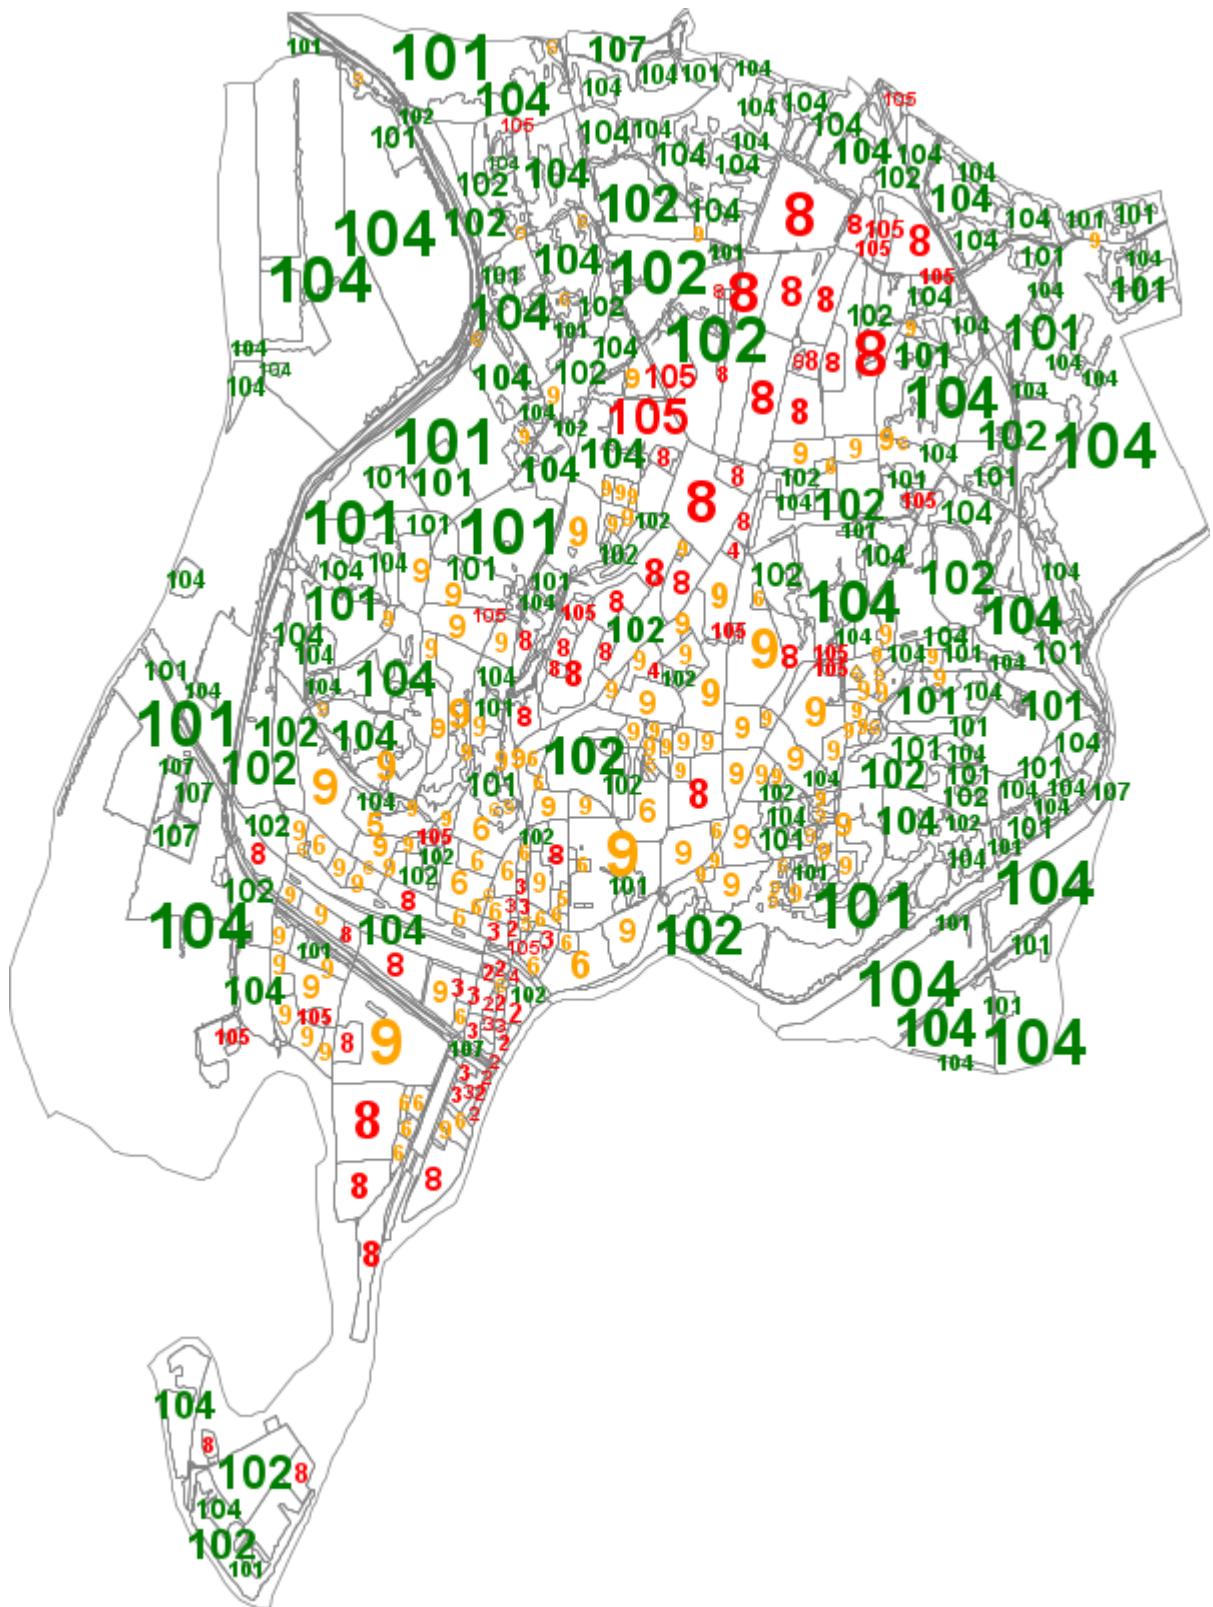

Figure A.18 – Proportional colored text
